MARINE AND COASTAL BIODIVERSITY: REVIEW, FURTHER ELABORATION AND REFINEMENT OF THE PROGRAMME OF WORK

Rapid assessment of marine and coastal biological diversity: a progress report on the development of methods and guidance

Note by the Executive Secretary

I. INTRODUCTION

- 1. In paragraph 25 of its decision V/20, the Conference of the Parties recognized that there is a need to improve the quality of the scientific, technical and technological advice provided to it. In paragraph 29(a) of the same decision, the Conference of the Parties requested SBSTTA to identify, and where needed, further develop procedures and methods to undertake or participate in scientific assessments, or make use of existing ones. In response to this, SBSTTA, at its sixth meeting adopted recommendation VI/5, on the development of methodologies and identification of pilot studies for scientific assessments, including those relating to marine and coastal biological diversity.
- 2. In response to recommendation VI/5, paragraph 6(c), the Executive Secretary prepared, for the consideration of the seventh meeting of SBSTTA, a project brief concerning the development of rapid assessment methods for marine and coastal biological diversity, in particular ecosystem evaluation and assessment (UNEP/CBD/SBSTTA/7/3, annex II, section A 2). The project brief outlined a procedure, which will provide guidance on the use of existing rapid assessment methods, including the suitability of particular methods for a given purpose, as well as the required resources, such as time, financial considerations, institutional and human resources, for undertaking a particular assessment. This document provides a progress report, including a draft of the guidance under preparation.
- 3. The guidance being created uses as its basis the guidelines developed during the Expert Meeting on Methods and Guidelines for the Rapid Assessment of Biological Diversity of Inland Water Ecosystems, which was held in Montreal from 2 to 4 December 2002. The draft guidance, which is contained in this document, is currently under review by a Liaison Group. This group, which is operating electronically through a listsery and a restricted web site, has representatives from the following

/

^{*} UNEP/CBD/SBSTTA/8/1.

organizations or assessments: The Global International Waters Assessment (GIWA); Marine Rapid Assessment Programme of Conservation International; Atlantic and Gulf Rapid Reef Assessment (AGRRA); Ramsar Convention; UNEP-WCMC; Northwest Hawaiian Islands Rapid Reef Assessment (NOW-RAMP); The Intergovernmental Oceanographic Commission (IOC) of UNESCO; The Global Programme of Action for the Protection of the Marine Environment from Land-based Activities (GPA); Land-Ocean Interactions in the Coastal Zone (LOICZ); Reef Check; Reefs at Risk of the World Resources Institute; Coral Reef Degradation in the Indian Ocean (CORDIO); Arctic Assessment and Monitoring Programme; FAO Fisheries Division; the Convention for the Protection of the Marine Environment of the North-East Atlantic (OSPAR Convention); WWF; IUCN; Global Marine Assessment (GMA); Caribbean Environment Programme; South Pacific Environment Programme; the SPA protocol of the Mediterranean Action Plan; Eastern African Regional Seas Programme; Regional Coordinating Unit for East Asian Seas; and Regional Organization for the Protection of the Marine Environment (ROPME). The guidance will be finalized for the consideration of SBSTTA at its ninth meeting.

4. The draft document is presented here for the information of SBSTTA. Recognizing that the underlying principles for rapid assessment are the same for both marine and freshwater environments, this document does not attempt to duplicate the information contained in Annex III to document UNEP/CBD/SBSTTA/8/INF/5, but rather provides a short summary of the main points of that document, followed by a detailed elaboration, in the annexes to this document, of methods for the rapid assessment of marine and coastal biological diversity. For a more in-depth coverage of theoretical and methodological aspects of rapid assessment in general, the reader is therefore referred to the guidelines contained in annex III to the report of the Expert Meeting on Methods and Guidelines for the Rapid Assessment of Biological Diversity of Inland Water Ecosystems (UNEP/CBD/SBSTTA/8/INF/5).

II. RAPID ASSESSMENT – DEFINITIONS AND ISSUES

- 5. For the purpose of this document, rapid assessment can be defined as: "a synoptic assessment, which is often undertaken as a matter of urgency, in the shortest timeframe possible to produce reliable and applicable results".
- 6. This definition was originally developed by the Expert Meeting on Methods and Guidelines for the Rapid Assessment of Biological Diversity of Inland Water Ecosystems. It was noted that rapid assessment methods are not generally designed to take into account temporal variance, such as seasonality, in ecosystems. However, some rapid assessment methods can be (and are being) used in repeat surveys as elements of an integrated monitoring programme to address such temporal variance.
- 7. Rapid assessments can range from desk studies, expert group meetings and workshops to field surveys. They can include compiling existing expert knowledge and information, including traditional knowledge and information, and field survey methods.
- 8. Rapid assessments can be undertaken at a wide range of spatial scales. In general a large-scale rapid assessment will consist of the application of a standard method to a larger number of localities or sampling stations.
- 9. Assessments can be divided into three stages: design/preparation, implementation and reporting. "Rapid" should be applied to each of these stages. Rapid assessments provide the necessary results in the shortest practicable time although preparatory and planning work prior to the survey may be imeconsuming. Under some circumstances (for example when taking into account seasonality) there may be a delay between the decision to undertake the assessment and the carrying out of the assessment. In other cases (for example in cases of disturbances and disasters) the assessment will be undertaken as a matter of urgency, and preparatory time should be kept to a minimum.

III. A CONCEPTUAL FRAMEWORK FOR RAPID ASSESSMENT

- 10. A conceptual framework for rapid assessment was developed by the Expert Meeting on Methods and Guidelines for the Rapid Assessment of Biological Diversity of Inland Water Ecosystems. This framework, which was derived from the Ramsar Framework on Wetland Inventory, is general enough to also be applicable in the marine environment.
- 11. The process of applying the conceptual framework is summarized in figure 1. Steps in the conceptual framework, and guidance for their application are listed in table 2.

Figure 1. Summary of key steps in applying the conceptual framework for rapid assessment (see Table 2 for further details)

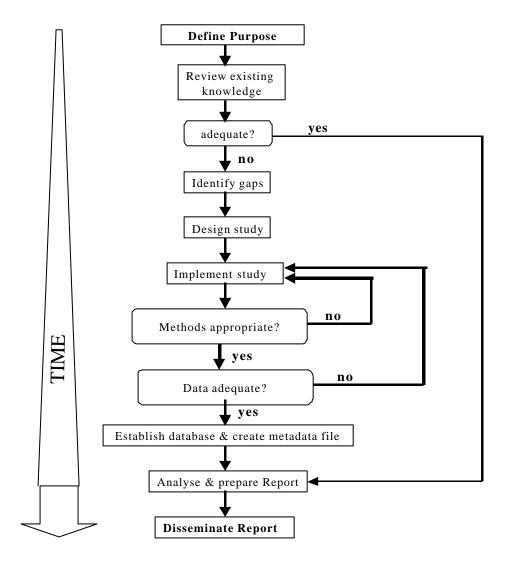

Table 1. Conceptual framework for designing and implementing a rapid assessment of marine and coastal biodiversity

| Step | Guidance |
|--|--|
| 1. State the purpose and | State the reason(s) for undertaking the rapid assessment: why |
| objective | the information is required, and by whom it is required. |
| a. Determine scale and | Determine the scale and resolution required to achieve the |
| resolution | purpose and objective. |
| b. Define a core or | Identify the core, or minimum, data set sufficient to describe |
| minimum data set | the location and size of the site(s) and any special features. |
| | This can be complemented by additional information on |
| | factors affecting the ecological character of the site(s) and |
| 2 Designation of the control of | other management issues, if required. |
| 2. Review existing knowledge and information – id gaps (if | Review available information sources and peoples' knowledge (including scientists, stakeholders, and local and |
| done, write report, if not, design | indigenous communities), using desk studies, workshops etc, |
| study) | so as to determine the extent of knowledge and information |
| study) | available for marine and coastal biodiversity in the region |
| | being considered. |
| | |
| | It is important to include identification of not just local data |
| | and information but also other relevant national and |
| | international sources, which can provide supplementary data |
| | and information to underpin the rapid assessment. |
| 3. Study design | |
| a. Review existing | Review available methods and seek expert technical advice as |
| assessment methods, | needed, to choose the methods that can supply the required |
| and choose | information. Apply the rapid assessment decision tree and |
| appropriate method | choose appropriate field survey methods. |
| b. Establish a habitat | Choose a habitat classification that suits the purpose of the |
| classification system where needed | assessment, since there is no single classification that has been globally accepted. |
| c. Establish a time | Establish a time schedule for: a) planning the assessment; b) |
| schedule | collecting, processing and interpreting the data collected; and |
| Schedule | c) reporting the results. |
| | |
| d. Establish the level of | Establish the extent and reliability of the resources available |
| resources required, | for the assessment. If necessary make contingency plans to |
| assess the feasibility & | ensure that data are not lost due to insufficiency of resources. |
| cost effectiveness that | Assess whether or not the program, including reporting of the |
| are required | results, can be undertaken within the current institutional, financial and staff situation. |
| | Determine if the costs of data acquisition and analysis are |
| | within budget and that a budget is available for the program to |
| | be completed. [Where appropriate, plan a regular review of |
| | the program.] |
| | |
| | |
| | |
| e. Establish a data | Establish clear protocols for collecting, recording and storing |
| management system | data, including archiving in electronic or hardcopy formats. |
| and a specimen | Ensure adequate specimen curation. This should enable future |
| curation system | users to determine the source of the data, and its accuracy and |

| Step | Guidance |
|--|--|
| | reliability, and to access reference collections. |
| | At this stage it is also necessary to identify suitable data |
| | analysis methods. All data analysis should be done by |
| | rigorous and tested methods and all information documented. |
| | The data management system should support, rather than |
| | constrain, the data analysis. |
| | |
| | A meta-database should be used to: a) record information |
| | about the inventory datasets; and b) outline details of data |
| | custodianship and access by other users. Use existing |
| | international standards. |
| f. Establish a reporting | Establish a procedure for interpreting and reporting all results |
| procedure | in a timely and cost effective manner. |
| | The reporting should be succinct and concise, indicate |
| | whether or not the objective has been achieved, and contain |
| | recommendations for biodiversity management action, |
| | including whether further data or information is required. |
| g. Establish a review and | Establish a formal and open review process to ensure the |
| g. Establish a review and evaluation process | effectiveness of all procedures, including reporting and, when |
| evaluation process | required, supply information to adjust the assessment process. |
| 4. Perform study and include | Undertake study method. Test and adjust the method and |
| continuous assessment of | specialist equipment being used, assess the training needs for |
| methodology (go back and | staff involved, and confirm the means of collating, collecting, |
| revise design if needed) | entering, analysing and interpreting the data. In particular, |
| , | ensure that any remote sensing can be supported by |
| | appropriate "ground-truth" survey. |
| 5. Data assessment and reporting | Establish a formal and open review process to ensure the |
| (was purpose of the study | effectiveness of all procedures, including reporting and, when |
| achieved? If not, go back to | required, supply information to adjust or even terminate the |
| step 3) | program. |
| | Results should be provided in appropriate styles and level of |
| | detail to, inter alia, local authorities, local communities and |
| | other stakeholders, local and national decision-makers, donors |
| | and the scientific community. |

II. THE RAPID ASSESSMENT DECISION TREE

- 12. The rapid assessment decision tree is a schematic guide to a number of available methods used for rapid assessment of marine and coastal biological diversity. The decision three is meant to enable selection of appropriate biodiversity assessment methods, based on a structured framework of selection criteria. The tree begins with the most basic and broad elements of an assessment, and advances through progressively more selective criteria. Eventually a general framework of the necessary assessment should emerge, taking the amalgamated form defined by its purpose, output information, available resources, and scope. The idea is to meld informational parameters, like output and purpose, with logistical parameters such as time frame, available funding, and geographical scope, in order to present a realistic assessment model and determine what methods are available for its implementation.
- 13. The following paragraphs provide guidance on the application of the decision tree in the context of rapid assessment of marine and coastal biological diversity.

- 14. Defining the purpose is the first step of a biodiversity assessment. The decision tree (figure 2) provides three general purposes for an assessment, which correspond to five specific purposes, and will determine the assessment type. The five specific assessment types used in the decision tree are: *Inventory Assessment, Specific-species Assessment, Change Assessment, Indicator Assessment, Economic Resource Assessment.* These are organized numerically and coordinated with their output information presented in Tables 3-7 in Annex 1. The assessment types are explained below. For additional detail, please refer to the report of the Expert Meeting on Methods and Guidelines for the Rapid Assessment of Biological Diversity of Inland Water Ecosystems.
- 15. *Inventory assessments* focus on overall biological diversity rather than extensive or detailed information about specific taxa or habitats. The goal is to gather as much information as possible about the ecosystem through extensive and, as much as possible, comprehensive sampling of its biological constituents. An inventory assessment provides initial information about a defined area of interest. The output information could be useful in prioritizing species or areas of particular concern for conservation, identifying new species, and developing a broad view of the overall biodiversity of an area. Case study I in Annex IV provides an example of an inventory assessment.
- 16. Species-specific assessments provide a rapid appraisal of the status of a particular species or taxonomic group in a given area. The assessment provides more detailed biological information about the focus species within the context of its protection, use, or eradication (in the case of invasive species). Thus, this assessment type generally pertains to ecologically or economically important species and can provide rapid information about an important species in an area where its status is unknown or of particular interest. Likewise, the assessment can be used to confirm the status of species as threatened, endangered, or stable in a certain area. Data and output information focus on the target species within ecological, behavioural, cultural, and economic contexts. Case study II in Annex IV provides an example of a species-specific assessment.
- 17. Change assessments are undertaken in order to determine the effects of human activities (pollution, physical alterations, etc.) or natural disturbances (storms etc.) on the ecological integrity and associated biodiversity of an area. The information collected in this type of assessment can be either retroactive or proactive in nature. A retroactive approach aims to assess actual disturbances or alterations of various projects or management practices as they apply to biodiversity and biological integrity. In terms of biodiversity, this approach can be difficult without pre-disturbance (baseline) data for comparison, and therefore may require trend analyses or the use of reference sites or environmental quality standards (EQS), and may require methods that are not considered "rapid". Case study III in Annex IV provides an example of a change assessment.
- 18. *Indicator assessments* assume that biological diversity, in terms of species and community diversity, can tell us a great deal about the water quality, hydrology and overall health of particular ecosystems. Biomonitoring is often associated with this type of assessment. Biomonitoring traditionally refers to the use of biological indicators to monitor levels of toxicity and chemical content, but recently this type of approach has been more broadly applied to monitor the overall health of a system rather than its physical and chemical parameters alone. Case study IV in Annex IV provides an example of an indicator assessment.
- 19. Resource assessments aim to determine the potential for sustainable use of biological resources in a given area or water system. Data pertains to the presence, status and condition of economically important species, species on which livelihoods depend, or those with a potential for marketing. Ideally a resource assessment can facilitate the undertaking of ecologically sustainable development as an alternative to other destructive or unsustainable enterprises. Thus, a major objective of the resource assessment is to develop or determine sustainable use practices as viable economic options in areas with rich biological resources. For this reason, an important factor of resource assessment is the involvement of local communities and governments, for example through community biodiversity surveys. This

integrative approach is important to the successful implementation of any sustainable harvesting system. Another extension of a resource assessment may be to provide baseline information used to monitor the health of fisheries and other resources. Case studies Va and Vb in Annex IV provide examples of a resource assessment.

Defining the scope

- 20. After the purpose of the assessment has been determined, the next step in the process will define the scope of the assessment, taking into account available resources. Potential resource limitations may exist in terms of available **time**, **money and expertise**, and such limitations determine the methodologies available for a particular assessment project. Furthermore, they define the project in terms of its scope in the following areas: *Taxa*, *Geography*, *Site Selection*, *Analysis*, *Data*, *Sampling Methods*. These are important components of a biodiversity assessment and the scope, or capacity of each vary depending on the project needs and its resource limitations.
- 21. In order to define the scope of the assessment, the reader should proceed to the tables in Annex I to this document as follows:
 - For **inventory assessment** proceed to **table 3**
 - For species-specific assessment proceed to table 4
 - For **change assessment** proceed to **table 5**
 - For **inventory assessment** proceed to **table 6**
 - For **resource assessment** proceed to **table 7**
- 22. The available time, money and expertise form the topmost categories of the tables in Annex 2, and their availability determines to a great extent how ambitious the scope of the assessment can be in terms of taxonomy, geography, amount and type of data collected, etc. The following section provides the user a brief explanation of each of the categories in the tables.

Time

23. Although the definition of "rapid" is flexible, the term imparts that time is of the essence. The time frames used in the tables are broadly based on typical lengths of *rapid* biodiversity assessments and are separated as follows: *short* (1-7 days), *medium* (8-30 days), and *long* (30+ days). This refers to the amount of time to complete the entire project from start to finish, including transport, data collection, and preliminary analysis. Final analysis and results may take more time, but preliminary conclusions are important and need to be available quickly, else the purpose of a *rapid* assessment is lost.

Money

24. The amount of funding available for an assessment will, along with time, determine the capabilities and scope of a rapid biodiversity assessment. Because monetary amounts are relative, and broad categories cannot account for the fluid nature of currency values, a simple categorization is used. This is not based on values or actual monetary amounts, but rather on the relative amount of funding available to carry out the assessment. Therefore, available capital for a given assessment is either *Limited*, meaning that it can be considered limiting, or less than desired to carry out the objectives of the project, or *Ample*, meaning that there is enough money to carry out all elements of the assessment in a scientifically sound and usable way.

Expertise

25. For the purposes of this document, an expert can be defined as someone who can identify specimens of a taxonomic group to the species level, is familiar with current sampling and collection methods, can analyse data, and is familiar with the taxonomic group within a larger biological and ecological context. It does not refer to people with a general understanding or basic knowledge in the field.

26. Institutional support refers to the use of technical facilities for analysis, storage of data, and other forms of support. Expertise should be considered with the availability of institutional support, as a limitation to the capacity and scope of any project. The decision tree delineates this category as 'yes' or 'no', meaning that individuals who are experts in the field of study (including local experts) are or are not available for the assessment project.

Taxonomic scope

27. The taxonomic scope depends on how many and which taxonomic groups will be involved in the study. Some surveys may focus solely on major benthic cover types, while others may include fish, invertebrates, and other taxonomic groups. Typically the purpose of the assessment will determine which groups are pertinent to the study, as certain taxonomic groups will be more or less useful in certain assessment types.

Geographical scope

28. The geographic scope of an assessment depends on the taxonomic groups involved and/or the size of the area relevant to the project. The geographic scope can vary depending upon the extent of a particular ecosystem or habitat, the range of a particular species, or the area affected by an impact. The geographic scope will also vary depending on how large an area must be studied in order to obtain statistically sound data.

Data

29. In the context of rapid assessment, data used should be of the appropriate type and quality for their intended use. If more resources are available in time, money and expertise, the possibilities of obtaining reliable data and sound statistical results are higher. In addition, it is important to gather pre-existing information on the site, the species, and the habitats to gain better insight on the types of data, sampling designs and analyses needed in the assessment. The tables give an indication of the general types of data that would be collected in the context of the assessment.

Site Selection

30. Site selection refers to the number and type of sites needed for the assessment. The number of sites is dealt with in the section data and analysis. Like the geographic scope, the site selection is highly dependent on other aspects of the assessment. An inventory requires a relatively broad assessment of the biodiversity at several sites with variable habitats. A species-specific assessment would concentrate on habitats used by the target species, and may forego several sampling sites in order to provide greater depth of study in fewer sites. Site selection for an impact assessment would concentrate on sites associated with the impact in question. Resource assessment sites focus on areas that could be used for exploitation. An indicator assessment would include as many sites as are needed to produce the necessary data.

Methods

31. The type of sampling methods used is determined according to the objective of the assessment. Table 8 in Annex II provides an overview of a number of relevant sampling methods for habitats, major taxonomic groups and water quality.

Analysis

32. Depending on the data collected and the purpose of the assessment, methods used for analyses could be simple descriptive, univariate, EDA (exploratory data analysis), or multivariate (clustering, similarity analysis, ordination, MANOVA). The table offers some suggestions on the general types of analysis that will be required for each assessment type.

^{*} Evaluate and choose specific methods from Table 8 (Appendix 3) depending on time and money, and habitat types sampled

Notes:

- Since the assessment types III, IV and V require information from assessment types I and II, most of the ones cited in this table deal with assessment I and II as well, but no always state whether they made the basic assessments or gather the info from other sources.
- All the programmes recorded in this table deal with assessments but all of them are not necessarily rapid.
- This table is the result of the review of some hundreds of references (mostly internet), but should not be considered a comprehensive review of all relevant assessments.

Annex II.

SAMPLING METHODS

Table 8. Sampling methods. Note: Cost estimations mostly calculated for equipment, chemicals (no salaries or fees)

| Taxon | Method | Application | Field Time | Cost | Habitat | Required expertise* | Possibility of collecting? | Equipment | | References for details of methods |
|------------------|--|---|------------------------|--|------------------|---|----------------------------|--|--|---|
| Water Quality | Physical probes | pH, O2, temperature, Oxygen Biological Demand (OBD), alcalinity | | \$100-3000 depending on number of probes and quality | All water bodies | none | no | 1 1 / | Hanna Instruments (2002) | English, Wilkinson and Baker, 1997 |
| | Secchi Disc | water transparency | short, 5-10 minutes | \$10 | All water bodies | none | no | | National Hunting and Fishing Supply (2002a) | English, Wilkinson and Baker, 1997 |
| | Water sample collection and Lab analysis | phosphates, total nitrogen, | in field, 3 | high - larboratory equipment | | training in using laboratory equipment | water samples | spectrophotometer, filters, bottles, water samples, net for reactive phytoplancton | Hanna Instruments (2002) | Strickland y Parson, 1972 |
| | visual assessment of sediment | sediment colour and type (organic, sandy clayish, etc) | minutes | 0 | all water bodies | none | sediment sample | grab sampler (can be done in conjunction with benthic invertebrate sampling) | Elcee Instruments and Service (2002) | English, Wilkinson and Baker, 1997 |

| Taxon | Method | Application | Field Time | Cost | Habitat | expertise* | Possibility of collecting? | Equipment | | for details of methods |
|-------|---|---|------------|---|--|--|----------------------------|---|-------------------------------|---|
| Fish | seine net (various types, purse, beach) | mostly smaller fishes | | \$50-\$250/ net, depending on size | shallow water without strong current, for big nets a boat could be needed for deployment and pulling | | not kill fishes | seine net, boat, measuring boards, scales, sheets, pencils, slates, plastic bags, plastic labels, preservative, GPS | and Fishing Supply | English, Wilkinson and Baker, 1997 |
| | Trawl (various types, beam, Otter) | Use only for fish and bottom dwelling animals, can be very destructive to the environment | 1-4 hours | \$1000 for nets, boat rental and field assistance | Any waters without obstacles on the bottom or surface debris | skill in trawling | fishes | trawl net, boat, measuring boards, scales, sheets, pencils, slates, plastic bags, plastic labels, preservative, GPS | and Fishing Supply | English, Wilkinson and Baker, 1997 |
| | Scoop and tray nets | suitable for small fish near surface, use only against banks | 1-5 hours | | Used in inaccessible areas, such as mangroves | Skill in using the nets but easy to learn | | Scoop and tray net, boat, measuring boards, scales, sheets, pencils, slates, plastic bags, plastic labels, preservative, GPS | Supply | English, Wilkinson and Baker, 1997 |
| | Push net | Catches only small organism | 1-2 hours | \$5-\$20/ net | Most shallow waters | Skill in using the nets but easy to learn | yes | Push net, boat, measuring boards, scales, sheets, pencils, slates, plastic | Supply | English, Wilkinson and Baker, 1997 |
| | Cast net | Suitable for small fish and prawns | 1-2 hours | net | Good for confined areas and shallow waters | Skill on cast. Operators vary on efficiency | yes | Cast net, boat, measuring boards, scales, sheets, pencils, slates, plastic | Hunting and Fishing Supply | |

| Taxon | | Application | | Cost | Habitat | expertise* | Possibility of collecting? | | | for details of methods |
|-------|-------------------------------|---|----------------------------|----------------------------|---|---|----------------------------|---|--|---|
| | Drop net | Small organisms | 1-2 hours | net | Good for small and shallow areas | Skills on construct and use. Labour intensive | | measuring boards, scales, sheets, pencils, slates, plastic | Supply | English, Wilkinson and Baker, 1997 |
| | Lift net | Small and rare species that must be concentrated | 1-2 hours | net | Good for small and shallow areas | Skills on use the net | | measuring boards, | and Fishing Supply | English, Wilkinson and Baker, 1997 |
| | fishing (various types) | Suitable for all species but used primarily for big and selective species (difficult to catch by other means) | 1-6 hours | spear gun | Any but clear waters. Difficult areas | Skill is obtained by practicing | | Spear gun and gear, boat, measuring boards, scales, sheets, pencils, slates, plastic bags, plastic labels, preservative, GPS | (2002) | English, Wilkinson and Baker, 1997 |
| | hook and line | suitable for any fish type and any water, depending on bait used | depending on repetition | depending on repetition | | fishing | | scales, sheets, pencils, slates, plastic bags, plastic labels, preservative, GPS | Hunting and Fishing Supply (2002a)/weight sswivels.html | |
| | (drift or | U | leave out overnight | pe line, depending | Any water, except high- relief hard bottom | Skill in longlining | | buoys, weights, boat, measuring boards, | Supply Company | English, Wilkinson and Baker, 1997 |

| Taxon | Method | Application | Field Time | Cost | Habitat | Required expertise* | Possibility of collecting? | Equipment | Sources of Equipment | |
|-------|----------------------------------|--|--|----------------------|--|--|----------------------------|--|----------------------------------|---|
| | Kill nets (see note below) | - X X | 12-24 hours- leave out overnight | | shallow to medium depth waters | Skill in setting the nets | | drift, trammel, block, encircling and/or gill nets, boat, measuring boards, scales, sheets, pencils, slates, plastic bags, plastic labels, preservative, GPS | and Fishing Supply Company | English, Wilkinson and Baker, 1997 |
| | Trap nets (see note below) | and types, primarily in shallow waters | based on tides (barrier and bag) | depending on size | shallow waters | Skill in setting the nets. Corral required expert people (fishermen) | | and/or fish corral, | and Fishing Supply Company | English, Wilkinson and Baker, 1997 |
| | fish traps | living fishes | 24 hours- leave out overnight | | motorized winch is needed | in right places. Fishermen support advised | not kill fishes | boat, measuring boards, scales, sheets, pencils, slates, plastic bags, plastic labels, preservative, GPS | Supply Company (2002g) | Wilkinson and Baker, 1997 |
| | Rotenone | | Minutes per site | | Encircle area with a net in shallow-open area. For deep waters, use it in caves and crevices | Skill on setting net | Yes | Rotenone, net, scoop | Aquaculture Supply (2002) | English, Wilkinson and Baker, 1997 |

| Taxon | Method | Application | Field Time | Cost | Habitat | expertise* | Possibility of collecting? | Equipment | Equipment | of methods |
|------------------|--|---|---|---|---|--|----------------------------|---|--------------------|--|
| | dive/ snorkeling (transects, stationary, roving) | surveying clear waters | | low (snorkeling) to high (scuba) | All clear waters | diving needs certification Identificatio n of species and survey design | | snorkel/scuba gear, underwater sheets, pencils and slates | | English, Wilkinson and Baker, 1997 |
| | questionnai re | fishermen about the fishes they observe and use | 2-4 hours | Low | | apply but require knowledge to prepare it | | Basic stuff for filling questionnaires | Everywhere | |
| | sonars | schooling, pelagic fish, not | depending on the size of the water body | | All waters, but mostly deep | Skill in operating the sonars | | | Surprise (2003) | |
| nverteb rates | search/ snorkel/ dive (quadrats,in tercept and band transects) | surveying clear waters and medium/big size animals | hour, but variable depending on repetition | (snorkeling) to high (scuba) | | diving needs certification | | snorkel/scuba gear, underwater sheets, slates and pencils, collecting material | | English, Wilkinson and Baker, 1997 |
| | kick net | all invertebrates inhabiting hard substrates | 1-5 hours | | good for wadable waters with gravel or stoney bottom | skill with kick nets | | kick net, basic stuff for taking notes and collecting material | | http://www. wavcc.org/w vc/cadre/Wa terQuality/ki cknets.htm |
| | Dip net | suitable for sampling nectic animals in shallow waters | 1-2 hours | \$5-\$20/ net | All waters | Skill in using dip nets | | collecting material | and Fishing | Downing & Rigler (1984) |

| axon | Method | Application | Field Time | Cost | Habitat | Required expertise* | Possibility of collecting? | Equipment | Sources of Equipment | References for details of methods |
|------|-------------------|---|----------------------|---|---|---|----------------------------|---|---|---|
| | Sledge | Semi- quantitative sampling. Suitable for epifauna (good info for caracterization) | About 1 site/hour | | Sof-bottom habitats | Skill on sledging | | Sledge, wire-mesh sieves, buoys, GPS, boat, sorting box, rope, jars and preservatives, waterproofs labels and pencils, forceps | Not available | English, Wilkinson and Baker, 1997 |
| | Dredge | At best, semi- quantitative data. Useful in broad area surveys and inventories | About 1 site/hour | dredge | Sof-bottom. Sample deeper into the substrate | | | | Wilflife Supply Company (2002) | English, Wilkinson and Baker, 1997 |
| | Trawl | Larger epifauna and demersal nekton (complementar y to other methods). Cualitative | 1 site/2-3 hour | \$1000 for nets, boat rental and field assistance | Soft-bottom | Skill in trawling | | Trawl, wire mesh sieves, GPS, boat, sorting box, rope, jars and preservatives, waterproofs labels and pencils, forceps | and Fishing | English, Wilkinson and Baker, 1997 |
| | Grab | Quantitative sampler of epifauna and infauna (particularly sedentary and slow-moving) | About 1 site/hour | \$350-\$1100 | Sof-bottom habitats | Skill in using grab | | Grab, hopper with base, wire mesh sieves, Rose Bengal stain, buoys, GPS, boat, sorting box, rope, jars and preservatives, waterproofs labels and pencils, forceps | Elcee Instruments and Service (2002) | English, Wilkinson and Baker, 1997 |
| | Surber sampler | all invertebrates inhabiting stony or gravel substrates | 1-3 hours | | gravel or stony bottom waters, mainly still waters | knowledge of using Surber and requirement s to quantify data | yes | | KC Denmark (2002) | Downing & Rigler (1984) |

| Taxon | Method | Application | Field Time | Cost | Habitat | Required expertise* | Possibility of collecting? | Equipment | Sources of Equipment | References for details of methods |
|-----------------|---|--|--|-----------|---------------------------------------|---|----------------------------|---|---|---|
| | Aerial nets | for catching adult invertebrates | 1-5 hours | \$35-\$50 | land | skill in using aerial nets | | insect net, jars, preservatives, basic stuff for taking notes | BioQuip (2002) | Downing & Rigler (1984) |
| Zoopla nkton | box samplers | for plankton crustaceans and rotifers | 1-3 hours | \$100 | Any water | skill in using samplers | | samplers, basic stuff | McLane Resarch Laboratories (2002) | Downing & Rigler (1984) |
| | Plankton nets | For plankton | | | Any water | | | | | |
| Macrop hytes | visual search | note visible plants within certain area qualitative analysis | variable depending on area searched | Low | Any habitat (marine or coastal) | Identificatio n of species | | Basic stuff for taking notes and collecting material | Everywhere | NSW National Parks and Wildlife Service (2001) |
| | Random sampling | qualitative, more unbiased than a visual search | 1-5 hours | Low | Any habitat (marine or coastal) | Identificatio n of species and survey design | | Basic stuff for taking notes and collecting material | Everywhere | NSW National Parks and Wildlife Service (2001) |
| | Plots (size variable depending on type of vegetation) | Any coastal and marine vegetation. including mangroves. | Variable, depending, but usually 1plot/hour | Low | | Identificatio n of species and survey design | | Basic s tuff for taking notes and collecting material, measuring tapes | Everywhere | NSW National Parks and Wildlife Service (2001) |

Annex IV

CASE STUDIES

Case study I: Inventory assessment

Inventory assessment of the Ecological Reserve West-Central Cayo Coco (marine area), North-Central Cuba (conducted by the Coastal Ecosystems Research Center, Minister of Science, Technology and Environment, Cuba).

Background: Cayo Coco is the fourth biggest island of the Cuban archipelago and a very important tourist destination with some 3 000 rooms currently. This cay is located in the central part of Sabana-Camaguey islands, North-Central of Cuba. As part of the objectives of a sustainable development project funded by GEF, the Governments of Cuba and Canada and Capacity 21, eight protected areas are under development on this group of islands. The Ecological Reserve West-Central Cayo Coco includes marine and terrestrial environments (about 30% of these ecosystems in Cayo Coco region) but there is a lack of in-depth information about the marine biological diversity of the area, which is critical for the establishment of this protected area.

Purpose: to assess major groups of marine biodiversity of the Ecological Reserve West-Central Cayo Coco.

Assessment Type: Inventory

Resources:

Time: Medium length (four weeks) *Money*: Ample: \$20,000 USD

Expertise: Experts for each selected taxa were available, with a total of 6 scientists from the Coastal Ecosystem

Research Center.

Scope:

Taxa:

Marine flora

data: species lists, new species, health, morphotypes

methods: 40 sites sampled by visual census using quadrants.

analysis: relative abundance

Corals and gorgonians

data: species lists, new species, health, habitat characteristics, unique areas

methods: 40 sites sampled by visual census using quadrants

analysis: relative abundance, richness, density, comparisons of sampling sites, occurrence of special species

Fish

data: species list, new species, distribution

methods: 40 sites sampled by visual census using transects

analysis: species list, richness, new species, relative abundance, distribution patterns, correlations

between habitat, characteristics and abundance, ecological and

geographical structure in assemblages

Geographical:

Studies were focused on the marine area of the Ecological Reserve West-Central Cayo Coco.

Site selection:

Eight sites selected randomly were surveyed in each of the main habitats. They are: shallow reef drop-off (8-15 m); rocky pavement between reef drop-off and reef crest (4-6 m); front part of the reef crest (where *Acropora palmata* occurs, 2-3 m); rocky pavement back to the reef crest (1-2 m); reef lagoon (sandy bottom with patches of seagrasses).

Reference:

Hernández-Fernández, L., L. Clero y F. Pina. 2002. Inventario de la Reserva Ecológica Centro-Este de Cayo Coco. Resultado Científico del Centro de Investigaciones de Ecosistemas Costeros. 30pp.

Case study II: Species-specific assessment

Inventory assessment of the shark populations in the tourist area of Jardines del Rey, North-Central Cuba, (conducted by the Coastal Ecosystem Research Center, Minister of Science, Technology and Environment, Cuba).

Background: Fast tourism development has taken place in Jardines del Rey during the last 10 years due to the natural beauty of the area. One of the most promising sectors consists of marine activities, primarily diving and snorkeling. A Cuban-Canadian enterprise was planning to develop and isolated cay into a tourist destination and was concerned about the security of the tourists due to the abundance of sharks in the surrounding waters.

Purpose: to assess the sharks populations in the tourist spot Jardines del Rey, primarily in Cayo Paredón Grande

Assessment Type: Species-specific

Resources:

Time: Medium length (2 weeks)

Money: Ample: \$2 000 USD (a desk study and the editing of a video) *Expertise*: 1 ichthyologist for the report and 3 people to prepare the video.

Scope:

Taxa:

Sharks (few species recorded, nurse (*Ginglymostoma cirratum*), silky (*Carcharhinus falciformis*), reef (*Carcharhinus perezi*), great hammerhead (*Sphyrna mokarran*) and whale (*Rhincodon typus*))

Data:

fisheries data (species, zones and fishing gear), information gathered from interviews, field trips and video tapes about abundance and aggressive behavior of the sharks. No shark attack records are kept in Cuba.

Methods:

The desk study used existing information, which was compiled according to the objectives of this assessment (review of the data in the last 20 years from the books of catch of Fisheries Cooperatives, interviews, field work and video tapes)

Analysis:

With this very general information a document was prepared containing species list, abundance, distribution and observed aggressive behavior of the sharks. The document was complemented by a 10-minute video.

Geographic:

Jardines del Rey marine environment.

Pina, F. 2001. Tiburones del norte de la provincia Ciego de Ávila. Resultado Científico del Centro de Investigaciones de Ecosistemas Costeros. 11pp.

Case study III: Change assessment

Effects of the mitigation measures after the impacts of natural events and human-based actions on marine environment in the Bahía de los Perros and Bahía de Jiguey, North-Central Cuba (conducted by the Coastal Ecosystem Research Center, Minister of Science, Technology and Environment, Cuba).

Background: A development project to build a causeway to join the island of Cuba with Cayo Coco (see Case study I) was carried out in the late 1980s. This causeway divided the Bahía de los Perros, a big lagoon (about 1 000 km²) between the Cuba island and the cays located to the north, into two parts. It changed the hydrodynamics of the lagoon and the Bahía de Jiguey. During the same period of time, a very intensive drought took place in the region, which brought about an increase in the salinity of the lagoon. In order to counteract these changes, many mitigation measures were carried out in the 1990s. The purpose of the assessment was to determine whether the mitigation measures had been successful in improving environmental conditions in the lagoon.

Purpose: Determine if the mitigation measures have improved the environmental conditions of these lagoons.

Assessment Type: Change assessment

Resources:

Time: Medium length (four weeks) *Money*: Ample, \$25,000 USD

Expertise: Experts for each selected taxa and abiotic variables were available, with a total of 8 scientists from

the Coastal Ecosystem Research Center.

Scope:

Taxa:

Marine flora

data: species lists, health, morphotypes

methods: 20 sites sampled by visual censuses using quadrants and samples from macrozoobenthic survey (see below)

analysis: comparisons of sampling sites and with previous data, taking into account abiotic variables Macrozoobenthos:

data: species lists, abundance

methods: 20 sites sampled using dredge

analysis: relative abundance, richness, density, comparisons of sampling sites and with previous data, taking into account abiotic variables

Fish

data: fisheries data (species, zones and gears)

methods: review of the data in the last 20 years from the books of catch of Fisheries Cooperatives *analysis:* trend of catches (species, zones, fishing gear), taking into account both, biotic and abiotic variables.

Note: All this information was complemented with interviews of fisherman and local people.

Abiotic variables:

Chemical (Total phosphorous and Nitrogen, Nitrates, Nitrites, Ammonium, Phosphates, Silicates, Oxygen Biological Demand and Oxygen Chemical Demand) and physical features (pH, Dissolved Oxygen, Temperature, Salinity, Alcalinity, Transparency) of the water were measured and sediments were sample and examined (Determination of Organic Matter). Information about fresh water management was obtained from the agency in charge.

Geographical:

Studies were focused on the Bahía de los Perros and Bahía de Jiguey.

UNEP/CBD/SBSTTA/8/INF/13 Page 44

Site selection:

Previous and during the construction of the causeway both lagoon were surveyed several times. This assessment was carried out in most of these sites for comparisons through the time, though few new sites were selected taking into account current knowledge of the region.

Case study IV: Indicators assessment

Using macroalgae, corals and fish as indicators of the Jardines de la Reina coral reef health, South-Central Cuba (conducted by several scientific institutions of Cuba and USA using the Atlantic and Gulf Rapid Reef Assessment protocol).

Background: Cuban marine environment is relatively well known due to many years of research. However, no comprehensive assessment of the state of the main marine ecosystems of the Cuban archipelago using standardized methodology had been carried out. The Atlantic and Gulf Rapid Reef Assessment Initiative has developed a protocol to rapidly assess coral reef ecosystems. This protocol has been successfully used in the wider Caribbean during the past several years. Besides the example discussed here, in the same year (2001), assessments in two of the other three main Cuban island groups were carried out.

Purpose: to assess the health of the Jardines de la Reina coral reef ecosystem.

Assessment type: indicator assessment

Resources:

Time: Medium length (four weeks)

Money: Ample: \$75,000

Expertise: 13 scientists from Cuba and USA.

Scope:

Taxa:

Macroalgae

data: cover by morphotypes

methods: 53 sites sampled by visual censuses using quadrants.

analysis: relative abundance by morphotypes, comparisons of sampling sites there, Cuba and the Wider Caribbean.

Corals

data: species lists, number of colonies by species, cover by species, diseases, recent and old death), diameter and height of colonies, number of recruits, habitat characteristics

methods: 53 sites sampled by visual census using quadrants

analysis: relative abundance (density and cover), richness, health (diseases, death, diameter and height), recruitment, comparisons of sampling sites there, Cuba and the Wider Caribbean

Fish

data: species list, abundance and size of selected species

methods: 53 sites sampled by visual census using transects

analysis: species list, richness, new species, relative abundance, size structure, biomass, comparisons of sampling sites there, Cuba and the Wider Caribbean

Geographic:

Jardines de la Reina archipelago and its surroundings.

Site selection:

53 sites were selected using remote sensing imagery and the experience of guides in shallow reef drop-off (8-15 m) and front part of the reef crest (where *Acropora palmata* occurs, 2-3 m).

Case study Va: Resource assessment

To assess the utility of the Exuma Cays Land and Sea Park, the Bahamas, as a marine fishery reserve (conducted by the Nature Conservancy and University of Miami, USA)

Background: The Exuma Cays Land and Sea Park is located in central Bahamas. The Park was established by the government of the Bahamas in 1958. Although many studies have been carried out in the Park, its utility as a marine fishery reserve was unknown.

Purpose: to examine the effectiveness of this Park as a marine fishery reserve, determining the spatial distribution of grouper assemblages and coral reef habitats inside and outside the Park and examining potential patterns of groupers larval transport and adult spillover to outside areas of the Park.

Assessment Type: Resources Assessment

Resources:

Time: Long (3 months).

Money: Ample Expertise: Yes

Scope:

Taxa:

Benthic biota

data: inventory of species and coverage

methods: Visual censuses and collection of algae. Search for algae, sponges and benthic cnidarians species. Haphazard quadrants surveyed for coverage classes of substrata (sediment, rubble, hard reef) and lifeforms (seagrasses, algae, sponges, corals, octocorals). Point-intercept counts using quadrants for coverage of bottom (sediment, bare hard-bottom, algae, sponges, hard corals, octocorals and other benthic cnidarians), identifying the lifeforms to the lowest taxonomic level possible analysis: species list, comparisons of species list and coverage between sampling sites inside and outside and among the four types of hard-bottom (cluster, ANOVAs, Jaccard coefficient, Percent Similarity Index, Spearman rank correlation coefficient)

Groupers

data: species composition, abundance and size

methods: Visual censuses using transects

analysis: species list, richness, abundance, size structure, biomass, comparisons between sampling sites inside and outside and among the four types of hard-bottom (ANOVAs, ANCOVAs, Spearman rank correlation coefficient). Total number of eggs produced by adult, female Nassau Grouper (*Epinephelus striatus*)

Geographic:

Northern cays of the Exuma Cays Land and Sea Park

Site selection:

74 sites were surveyed in four types of hard-bottom (patch reef, channel reef, windward hard-bottom, and fringing reef).

Sluka, R., M. Chiappone, K.M. Sullivan and R. Wright. 1996. Habitat and life in the Exuma Cays, the Bahamas: The Status of Groupers and Coral Reef in the Northern Cays. The Nature Conservancy. 83pp.

Case study Vb: Resource assessment

Assessing the potential of Jardines del Rey coral reef ecosystems, North-Central Cuba, for sustainable use of aquarium fish (conducted by Institute of Oceanology, Minister of Science, Technology and Environment, Cuba)

Background: Trade of aquarium fish from tropical reef environment is a relatively new but profitable business. However, the activity could prove harmful for biological diversity and habitat health if it is not soundly developed. Knowledge about the standing stocks of the species extracted and the use of low-impact techniques are critical for the sustainable use of this sensitive resource. A resource assessment was carried out in order to investigate the feasibility of implementing a program on aquarium reef fish trade in Jardines del Rey.

Purpose: to assess the potential of Jardines del Rey coral reef ecosystems for sustainable harvesting of aquarium fish

Assessment Type: Resources Assessment

Resources:

Time: Medium (4 weeks). *Money*: Ample: \$25,000 USD

Expertise: Four Cuban ichthyologists were available.

Scope:

Taxa:

Small coral reef fish (small basses (Serranidae), basslets (Grammatiae), croakers (Scianidae), butterflyfishes

(Chaetodontidae), angelfishes (Pomacanthidae), jawfishes (Opistognathidae), damselfishes (Pomacentridae), blennies (Labrisomidae and Blenniidae) and gobies

(Gobiidae)

data:

Species composition, abundance

methods:

Visual censuses using transects

analysis:

Species list, richness, relative abundance, distribution patterns. Due to the lack of information about population dynamics and reproduction of the selected species, 10% of the population was proposed for extraction during the first year, using a zoned strategy, and taking into account abundance and distribution patterns. A monitoring program was carried out during the time the extraction took place in order to change this percentage if the level of use was under or over-estimated, and therefore ensuring the sustainable exploitation of these species. A protocol to catch the fish in an environmentally sound way was developed.

Geographic:

Jardines del Rey coral reef ecosystems, North-Central Cuba

Site selection:

40 sites (10 per habitat) were haphazardly selected and surveyed in shallow reef drop-off (8-15 m); rocky pavement between reef drop-off and reef crest (4-6 m); front part of the reef crest (where *Acropora palmata* occurs, 2-3 m) and rocky pavement back to the reef crest (1-2 m)
