There are also issues about inter-operability of scientific data on bio-diversity.

However, we hope to resolve these issues by learning from other parties to CBD and international organisations like GEOBON, IUCN, etc. We are currently designing and establishing a framework for tracking and monitoring, we support the way forward advocated by GEOBON, i.e. country specific assistance strategies.

Thank you.

INDIA

Dr. 14-15-2013: General Statement—

I wish to make a general statement

on Biodiversity Informatics.

The situation in India is that— we have

substantial data sets that are available

with various scientific institutions

and organizations. For example—

Botanical Survey of India, Zoological

Survey of India, National Remote

Sensing Agency. All these willful

data on vegetation and biodiversity.

The challenge, however, is to use this
data by bringing it on to a single

platform for measuring changes

over time and space.
