

artificial intelligence machine learning

AR / VR mixed reality

advanced sensor platforms

(x)D printing

technologies driving the 4IR

biotechnologies

autonomous vehicles

new materials

?????

geo-engineering

new computing technologies

Fourth Industrial Revolution technologies could:

create new forms of agency

provide a foundation for global governance

create models for better management of ecosystems help secure the world through new forms of transparency

inspire new data regulations and policies

shape new communities with both local and global reach usher in an era of sustainable products and services

Rapidly mitigate climate change and support ecosystem adaptation

promote clear accountability and data-driven decision making

spur innovation and new forms of growth

Fourth Industrial Revolution technologies *could*:

compromise human agency

undermine the traditional roles played by the nation state

have unanticipated consequences that irreversibly damage ecosystems democratize the ability to make massively destructive weapons

render existing online security protocols useless

dissolve communities, institutions, and social structures

produce nondegradable and toxic products have negative effects on the climate and environment

obscure lines of accountability for decision-making

make economic systems more fragile and volatile

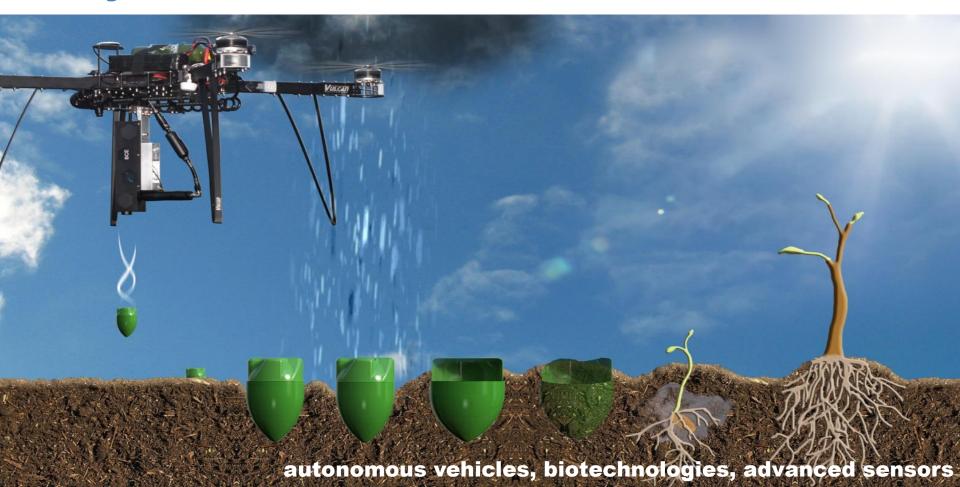

Who gains?

Who loses?

Who are we?

Ecosystem restoration - land

Ecosystem restoration - ocean
