

**Convention on
Biological Diversity**

Distr.
GENERAL

CBD/COP/14/INF/45
20 November 2018

ENGLISH ONLY

CONFERENCE OF THE PARTIES TO THE
CONVENTION ON BIOLOGICAL DIVERSITY

Fourteenth meeting

Sharm el-Sheikh, Egypt, 17-29 November 2018

Item 17 of the provisional agenda*

**INLAND WATERS IN RELATION TO THE POST 2020 GLOBAL BIODIVERSITY
FRAMEWORK**

Note by the Executive Secretary

1. The Executive Secretary is circulating herewith, for the information of participants in the fourteenth meeting of the Conference of the Parties, a document entitled “Inland Waters – Post 2020 targets”, prepared by the International Union for Conservation of Nature (IUCN) Species Survival Commission (SSC) and Freshwater Conservation Committee (FCSC), World Wide Fund for Nature (WWF) Natural Capital Project, Conservation International (CI), United States Geological Survey (USGS), InFish, Wetlands International, Alliance for Freshwater Life (AFL), and International Rivers.
2. The present document is relevant to the deliberations on agenda item 17 on the long-term strategic directions to the 2050 Vision for Biodiversity: approaches to living in harmony with nature and preparation for the post-2020 global biodiversity framework.
3. The document is being circulated in the form and language in which it was received by the Secretariat. The views expressed in the document are those of the authors and do not necessarily reflect the views of the Secretariat of the Convention on Biological Diversity.

* CBD/COP/14/17.

Inland Waters – Post 2020 targets

Our sustainable future depends upon targeted actions for conservation of inland waters.

The Global Biodiversity Outlook 4¹ suggests that the CBD's 2020 (Aichi) Targets to protect ecosystems and their biodiversity will not be achieved. This is especially the case for inland waters – rivers, lakes, springs, and other freshwater ecosystems often classified as inland wetlands. As much as 75% of the world's inland wetlands may have been lost during the 20th century, less than 40% of large rivers remain free flowing, and approximately one-third of the freshwater species assessed by the IUCN *Red List of Threatened Species* are threatened. **Freshwater species have the highest declines in population size (83% decline) according to the Living Planet Report.**²

Despite the dire state of inland waters, they receive inadequate dedicated attention. Often perceived as components of the lands in which they are embedded, inland waters conservation targets have been combined with terrestrial targets within the CBD's Aichi Targets (e.g., Target 11). This lumping obscures both the distinct threats that inland waters face, and the potential need for targets adjusted for their disproportionate levels of imperilment. As various assessments demonstrate, the current approach to conserving inland waters biodiversity is falling far short. The SDG 6.6 process calls for an ambitious target to “protect and restore water-related ecosystems” by 2020. In 2018, a High Level Panel on Water (HLPW) convened by the United Nations Secretary-General and President of the World Bank Group urged greater collective action to address the growing water crisis. The CBD has an important role to play in supporting these ambitious objectives.

‘Business as usual’ is not an option. **Policy makers need clearly defined targets and practical indicators for assessing progress towards the conservation and sustainable management of inland waters and their species.** Sustainable development requires better protection of inland waters, which are an essential component of this development, delivering an estimated US\$4 trillion of services annually in support of livelihoods. Water-related services are essential for sustaining all communities on Earth, and source catchments must be conserved to ensure the continued provision of those benefits.

The following recommendations are made:

- **Post 2020 targets must avoid the current trend of viewing the conservation of inland water ecosystems principally in terms of delivery of water.** For example, the HLPW Outcome document does not reference biodiversity in its recommendations on ‘Water and Environment.’ Clearer links must therefore be made between SDG goals 6 and 15 in the revision of targets for post 2020.
- **A post 2020 revision of the Aichi targets must explicitly include the conservation of inland water ecosystems in all relevant targets, as well as indicators supported by science,** with proven case studies to show how these recommendations can work under different conditions.
- **Effective post 2020 targets for inland waters will underpin achievement of most SDGs,** in particular SDGs 2, 6, 14, and 15. Special attention must be paid to SDG targets with a 2020 deadline.
- **CBD's post 2020 targets and their indicators for inland waters must place the protection of ecosystems and their biodiversity as the primary focus,** to sustain life, conserve species, and consequently provide human water security.

The freshwater conservation and research community is primed to work together and engage across sectors, with CBD Parties and other stakeholders in defining the pathway forward for inland waters in the post 2020 CBD and SDG frameworks.
