

Iraq:

Recently Iraq became the 192 party in the CBD , and as being one of the arid and semi arid region countries which is facing major challenges caused by climate change that is water scarcity which affected land use for agriculture ,and environmental pollution .

Food security is among it's significant priorities which was previously considered a good producer of different crops. The Iraqi policy now is concerned with biodiversity and ecosystems conservation ,such as the southern Iraqi marshes has and still considered as a natural habitat , there are greater opportunities than previously recognized to address the biodiversity crisis . Identifying those elements of biodiversity most essential to support mechanisms of conservation, and focusing on establishing protected areas, forest rehabilitation and minimizing, and desertification combat

Biofuel production is such a complex subject , there are needs of more researches , food and energy supply are on the top of our list of serving people needs all over the country

, because of conflict circumstances Our biodiversity has been much used in recent years and the more intelligent responsible use of our natural heritage is so much needed.
