RISK ASSESSMENT AND RISK MANAGEMENT (ARTICLES 15 AND 16)

Note by the Executive Secretary

I. INTRODUCTION

1. The Cartagena Protocol on Biosafety sets out provisions on risk assessment (Article 15 and Annex III) to identify and evaluate possible adverse effects of living modified organisms on the conservation and sustainable use of biodiversity, taking also into account risks to human health and risk management (Article 16) to enable Parties establish and maintain appropriate mechanisms, measures and strategies to regulate, manage and control risks identified in the risk assessment process according to provisions of the Protocol.

2. At its first meeting, the Conference of the Parties serving as the meeting of the Parties to the Protocol decided to consider at its fifth meeting a modality that might enable the identification of living modified organisms that are not likely to have adverse effects on the conservation and sustainable use of biodiversity, taking also into account risks to human health, with a view to arrive at a decision in accordance with paragraph 4 of Article 7.1

3. At their fourth meeting, in considering the need for further guidance on specific aspects of risk assessment and risk management, the Parties established an open-ended online forum on specific aspects on risk assessment through the Biosafety Clearing-House (BCH) and an Ad Hoc Technical Expert Group on Risk Assessment and Risk Management (AHTEG) with the terms of reference as annexed to the decision. In addition, the Parties to the Protocol requested the Executive Secretary to convene: (i) ad hoc discussion groups and at least one real-time online conference per region prior to each of the meetings of the AHTEG, with the view to identifying major issues related to specific aspects of risk assessment and

---

* UNEP/CBD/BS/COP-MOP/5/1.

1 Paragraph 7 (a) (i) of the annex to decision BS-I/12.
risk management as referenced in the annex to the decision; and (ii) two meetings of the AHTEG prior to the fifth meeting of the Conference of the Parties serving as the meeting of the Parties to the Protocol.²

4. In their consideration of capacity-building in risk assessment, the Parties, at their fourth meeting, further requested the Executive Secretary to: (i) coordinate and facilitate, along with other relevant United Nations bodies and other international organizations, the development of training on risk assessment and risk management in relation to living modified organisms; (ii) convene prior to the fifth meeting of the Parties, regional or subregional training courses to enable countries to gain hands-on experience in preparing and evaluating reports of risk assessments in accordance to the Protocol; and (iii) convene a workshop on capacity-building and exchange of experiences on risk assessment and risk management of living modified organisms in the Pacific subregion.³

5. In addition to addressing the need for further guidance on specific aspects of risk assessment as noted in paragraph 3, and in accordance with its terms of reference as set out by the Parties, the AHTEG was also requested to consider possible modalities for cooperation in identifying living modified organisms or specific traits that may have adverse effects on the conservation and sustainable use of biological diversity, taking also into account risks to human health. To assist the AHTEG in its deliberations, the Conference of the Parties serving as the meeting of the Parties to the Protocol requested Parties and invited other Governments and relevant organizations to submit scientifically sound information available, on the identification of living modified organisms or specific traits that may have adverse effects on the conservation and sustainable use of biological diversity, taking also into account risks to human health. The Parties also requested the Executive Secretary to compile the information received and to prepare a synthesis report for consideration by the AHTEG and the Parties.⁴

6. Accordingly, this note is prepared by the Executive Secretary to assist the Parties to the Protocol in their consideration of the agenda item on risk assessment and risk management. Section II contains an analysis of the main outcomes of the process for the development of further guidance on specific aspects of risk assessment. Section III contains an overview of the capacity-building activities undertaken in response to the requests of the meeting of the Parties. Section IV contains an overview of the submissions and recommendations regarding collaboration in identifying living modified organisms that may have an adverse effect on the conservation and sustainable use of biological diversity, taking also into account risks to human health.⁵ Section V provides some elements that may assist Parties in considering modalities for identifying living modified organisms that are not likely to have adverse effects on the conservation and sustainable use of biological diversity, taking also into account risks to human health.⁶ Section VI derives some conclusions and proposes some elements of a draft decision for the consideration of the Parties.

² Paragraphs 3, 4 and 6 of decision BS-IV/11.
³ Paragraphs 12 and 13 of decision BS-IV/11.
⁴ Paragraphs 3, 4 and 6 of decision BS-IV/11.
⁵ As per paragraph 4 (b) (iii) of the annex to decision BS-I/12.
⁶ As per paragraph 7 (a) (i) of the annex to decision BS-I/12.
II. FURTHER GUIDANCE ON SPECIFIC ASPECTS OF RISK ASSESSMENT

7. To implement the various elements of decision BS-IV/11 with regard to the development of further guidance on risk assessment, the Secretariat, in consultation with the Bureau of the Conference of the Parties serving as the meeting of the Parties to the Protocol, established a continuous process comprising three types of activities: (i) ad hoc online discussion groups; (iii) regional real-time online conferences; and (iv) face-to-face meetings of the AHTEG.

8. The process was initiated with the opening of the Open-ended Online Expert Forum on Risk Assessment and Risk Management (Online Forum) through the Biosafety Clearing-House.7

9. In a notification, the Executive Secretary invited Parties, other Governments and relevant organizations to nominate experts in risk assessment to the Online Forum by using the common format for nomination of Biosafety Experts. The Secretariat reviewed the nominations for completeness in accordance with the criteria and minimum requirements for biosafety experts as set out in decision BS-IV/4.

10. A total of 229 experts were registered in the Open-ended Online Forum. Among these, 153 experts were nominated by a total of 48 Parties, 11 experts by a total of five non-Parties and 65 experts registered as observers.8

11. As part of the preparation for the work of the AHTEG, eight ad hoc online discussion groups and four regional real-time online conferences (Europe, Latin America, Africa and Asia) were held under the Online Forum between November 2008 and February 2009.9

12. Participants for the AHTEG were selected on the basis of their active participation in the events of the Online Forum, in accordance with the consolidated modus operandi of the Subsidiary Body on Scientific, Technical and Technological Advice (SBSTTA) of the Convention on Biological Diversity,10 as requested in decision BS-IV/11 and in consultation with the Bureau of the Conference of the Parties serving as the meeting of the Parties to the Protocol. The list of participants of the AHTEG is attached hereto as annex I.

13. The first meeting of the AHTEG on Risk Assessment and Risk Management was held in Montreal from 20 to 24 April 2009. Eighteen participants from seventeen Parties, as well as eight observers from three non-Parties and five organizations attended the meeting as members of the AHTEG.

14. Between the two meetings held by the AHTEG, a number of activities took place with the view to advancing the draft of the guidance on each of the specific issues indentified in the first meeting of the AHTEG and to test the Roadmap as mandated by the Parties, as follows:

7 Available at http://bch.cbd.int/onlineconferences/forum_RA.shtml .
8 The list of participants is available at: http://bch.cbd.int/onlineconferences/participants_ra.shtml .
10 Paragraph 18 of annex III to decision VIII/10 of the Conference of the Parties.
(a) **Under the Open-ended Online Forum**: ten ad hoc discussion groups and four regional real-time online conferences (Africa, Asia and the Pacific, WEOG and CEE, and GRULAC),\(^\text{11}\) and

(b) **Under the AHTEG**: five rounds of online discussions groups, two teleconferences of the AHTEG Bureau, and face-to-face meetings of the Sub-Working Group on the Roadmap and AHTEG Bureau.\(^\text{12}\)

15. The activities listed in paragraph 14 above alternated between the Open-ended Online Expert Forum and the AHTEG in order to create a feedback loop for each new draft version of the guidance documents prepared by the AHTEG sub-working groups and to enable the participation of a broad number of experts throughout the process.

16. The second meeting of the AHTEG took place from 20 to 24 April 2010 in Ljubljana, Slovenia. The meeting was attended by fourteen members of the AHTEG from Parties, as well as two members from non-Parties and four from organizations.

17. A complete list of activities carried out under the Online Forum and AHTEG is attached hereto as annex II.

**A. Outcomes of the Open-ended Online Expert Forum on Risk Assessment and Risk Management**

18. Recommendations from the Online Forum to the AHTEG prior to its first meeting were on the following:

   (a) The development of guidance on the following specific aspects of risk assessment and risk management: (i) living modified fish, trees, microorganisms and pharmaplants; (ii) living modified organisms with stacked genes or traits; (iii) specific receiving environments; and (iv) post-release monitoring and long-term effects of living modified organisms released into the environment; and

   (b) An action plan for the development of guidance materials on specific prioritized aspects as well as the roadmap.

19. After the first meeting of the AHTEG, the discussions under the Open-ended Online Expert Forum assisted in advancing the draft and testing of the Roadmap, as well as in developing the guidance on specific aspects of risk assessment that were identified by the AHTEG as priorities (i.e. living modified mosquitoes, living modified crops with tolerance to abiotic stress and living modified organisms with stacked genes).

20. During several rounds of discussions, Experts of the Online Forum provided substantial input to the AHTEG on the contents of the Roadmap and specific aspects of risk assessment. In testing the Roadmap, the majority of views were positive about its usefulness and relevance, and several recommendations were made on ways to improve the user-friendliness of the Roadmap.

\(^{12}\) The meetings of the Sub-Working Group on the Roadmap and AHTEG Bureau were held in The Hague from 12 to 14 October 2009.
21. During the last round of ad hoc discussion groups, members of the Online Forum were invited to make recommendations to the meeting of the Parties for its consideration at its fifth meeting on the way forward for the risk assessment and risk management processes. Forum participants expressed views on the usefulness of the Roadmap and guidance on specific aspects of risk assessment and noted that these documents should be regularly revised and updated in order ensure its relevance and keeping in tune with new developments.

22. The participants of the Online Forum also noted the need for the development of additional guidance on other specific aspects of risk assessment. The risk assessment topics listed in information documents UNEP/CBD/BS/COP-MOP/5/INF/12 and UNEP/CBD/BS/COP-MOP/5/INF/13 were noted by the Forum as a starting point for the development of further guidance. In addition participants also recommended that the following topics be considered: (i) establishing risk scenarios; (ii) risk management strategies, including post-release monitoring of the impacts of living modified organisms released into the environment; (iii) uncertainty and variability analysis; (iv) a “checklist” containing critical elements of the risk assessment process; and (v) how to better link the risk assessment process under the Protocol to provisions and decisions under the Convention on Biological Diversity.

23. It was further recommended during the Online Forum discussions that, in developing new guidance, consultation among Parties should be continued and that existing guidance developed by other international bodies (e.g., OECD, IPPC) should be taken into consideration.

24. With regard to a mechanism to address the development of further guidance, a large number of experts recommended an AHTEG, online discussions and information exchange through the BCH, or a combination of these. Additional examples of mechanisms to address the development of guidance included consultation among experts and a pool of resource experts to implement follow-up training once the guidance is developed.

25. The views and recommendations made under the Open-ended Online Expert Forum are synthesized and made available as information documents for consideration by the Parties (UNEP/CBD/BS/COP-MOP/5/INF/12 and 14).

**B. Outcomes of the Ad Hoc Technical Expert Group on Risk Assessment and Risk Management**

26. The main outcomes of the first meeting of the AHTEG were (i) a draft of the Roadmap; (ii) identification and prioritization of three other specific issues of risk assessment (i.e. living modified mosquitoes, living modified crops with tolerance to abiotic stress and living modified organisms with stacked genes) for the development of guidance; (iii) establishment of four sub-working groups to focus on each of the issues identified; and (iv) development of an action plan made up of a summary of the terms and procedures for the development of guidance prior to the second meeting of the AHTEG.

27. During its intersessional period, in consultations with the Open-ended Online Expert Group, the AHTEG sub-working groups further developed the draft documents for guidance on the four specific issues of risk assessment and tested the draft Roadmap for Risk Assessment of Living Modified Organisms.

---

28. At its second meeting, the main outcomes of the AHTEG were:

   (a) Finalization of the document entitled “Guidance on Risk Assessment of Living Modified Organisms” and divided into two sections entitled “Part I: Roadmap for Risk Assessment of Living Modified Organisms” and “Part II: Specific Types of Living Modified Organisms and Traits” (i.e. living modified crops with tolerance to abiotic stress, living modified mosquitoes and living modified organisms with stacked genes or traits). This document is attached here to as annex III and will also be made available through the BCH; 15

   (b) Recommendations to the Secretariat on how to integrate and update the guidance document produced by the AHTEG and tools for retrieval of background materials available in the Biosafety Information Resources Centre of the BCH; and

   (c) An assessment of the action plan established at its first meeting.

29. The AHTEG also made recommendations to the Parties at their fifth meeting for further development of guidance on additional topics of risk assessment, particularly on those specific issues of risk assessment that were identified and prioritized during the Open-ended Online Forum and first meeting of the AHTEG.

30. The report of the first meeting and final report of the AHTEG are available as information documents for consideration by the Parties. 16

31. The full set of recommendations from the AHTEG to the fifth meeting of the Parties is attached hereto as annex IV.

III. CAPACITY-BUILDING IN RISK ASSESSMENT

32. In response to the request by the Parties on capacity-building in risk assessment, the Secretariat coordinated a multi-stakeholder process for the development of training in collaboration with United Nations organizations (Aarhus Convention of the United Nations Economic Commission for Europe, International Plant Protection Convention of the Food and Agriculture Organization of the United (FAO) and the United Nations Environment Programme (UNEP)), other international organizations (Global Industry Coalition and Third World Network) and the academic sector (University of Canterbury and University of Minnesota).

33. The development of training was undertaken in a step-wise manner. The Secretariat first prepared an outline of the training and invited collaborators to provide input and comments. Thereafter, on the basis of the various feedbacks, the Secretariat prepared a draft training manual and invited the collaborators for peer-review. The draft manual was then revised by the Secretariat on the basis of the feedback and comments provided during the peer-review process.

34. While using the provisions of the Cartagena Protocol on Biosafety, particularly its Annex III, as a basis for drafting and reviewing the emerging training manual, the Secretariat also attempted to incorporate experience and current practice from number of national regulatory frameworks and international organizations in a comprehensive manner.

---

35. The outcome of this process is a draft training manual entitled “Risk Assessment of Living Modified Organisms”, which comprises four modules: (i) Overview of Biosafety and the Cartagena Protocol on Biosafety; (ii) Preparatory Work – Understanding the Context in which a Risk Assessment is Carried Out; (iii) Conducting the Risk Assessment; and (iv) Preparing a Risk Assessment Report.

36. The training manual is available as an information document and through the BCH for consideration by the Parties.17

37. To further address the request of the Parties to convene capacity-building activities with the view to enabling countries to exchange experience and gain hands-on knowledge in preparing and evaluating risk assessment reports in accordance with the Protocol, the training manual described above was used during the following activities:

(a) The Pacific subregional workshop on capacity-building and exchange of experiences on risk assessment in Nadi, Fiji, from 4 to 7 July 2010; and

(b) The Asian subregional training course on risk assessment of living modified organisms in Siam Reap, Cambodia, from 12 to 16 July 2010.

38. Twelve participants from six Parties to the Protocol (Fiji, Kiribati, Niue, Samoa, Solomon Islands and Tonga), two non-Party countries (Cook Islands and Vanuatu) and one organization (University of Canterbury, New Zealand) attended the Pacific subregional workshop. Twenty-three participants from fifteen Parties to the Protocol (Bhutan, Cambodia, India, Indonesia, Islamic Republic of Iran, Lao People’s Democratic Republic, Malaysia, Mongolia, Myanmar, Pakistan, Syrian Arab Republic, Thailand, Turkmenistan, Viet Nam and Yemen), a non-governmental organization (Third World Network) and the United Nations Environmental Programme attended the training course for Asia. One resource person from the Netherlands also took part in the Asian training course.

39. Participants were invited to answer a questionnaire to evaluate the Pacific workshop and the Asian training course. Results of the questionnaire indicated a general agreement that these activities (i) provided hands-on training in preparing and evaluating risk assessment reports in accordance to the articles and Annex III of the Protocol; (ii) helped develop skills on how to use and interpret existing information, as well as identifying and addressing information gaps; and (iii) helped to understand how to establish baseline information relevant for the risk assessment.

40. Results of the questionnaire also indicated that the majority of participants agreed that the training manual prepared by the Secretariat in collaboration with other United Nations bodies and relevant organizations (i) is a useful tool for training on risk assessment; (ii) is easy to understand in a stepwise manner; (iii) comprises an adequate overview of the risk assessment process, and (iv) is useful for a wide range of users.

41. In providing further feedback, participants considered the training manual a very good teaching tool that provides a well-structured and comprehensive introduction to the risk assessment process and is useful to Parties as well as to other countries and relevant organizations. With the view to improving its usefulness, participants noted that the training manual should:

(a) Be further improved by, *inter alia*, adding a glossary of terms, list of acronyms, flowcharts, diagrams, examples of other non-crop living modified organisms, etc;

(b) Integrate elements from the “Guidance on Risk Assessment of Living Modified Organisms” developed by the AHTEG, namely from the Roadmap (e.g. flowchart) and from the guidance on the specific types of living modified organisms and traits (i.e. risk assessment of living modified mosquitoes, living modified organisms with stacked genes or traits and living modified crops with tolerance to abiotic stress); and

(c) Be presented through a more user-friendly learning tool (e.g. as an interactive software); and

(d) Be published in all United Nations languages.

42. The participants to the Pacific workshop and Asian training course agreed that the following elements/activities could be considered by the Parties at their fifth meeting:

*Capacity-building on risk assessment:*

(a) Further training courses on risk assessment at the national level or for smaller geographical areas (e.g. around 5-7 countries) where the receiving environment is similar to allow the participation of a core team of country experts per country;

(b) Follow-up advance training in risk assessment focusing, for example, on different types of intended uses (i.e. introduction into the environment and living modified organisms for direct use as food, feed, or for processing) and different types of living modified organisms;

(c) Dedicated training courses on: (i) preparing risk assessment reports and recommendations; (ii) extracting relevant data from notifications; (iii) assessing the quality of data submitted the application; and (iv) establishing detailed baseline information;

(d) Training of trainers who can further carry out capacity-building at national level;

*Guidance on risk assessment:*

(e) Publication and distribution of the AHTEG “Guidance on Risk Assessment of Living Modified Organisms”, including an online version on the Biosafety Clearing-House, in all United Nations languages;

(f) Development of further guidance on risk assessment as recommended by the AHTEG;

*General capacity-building on biosafety:*

(g) Further regional training on the identification of living modified organisms; and

(h) Training of decision-makers on the interpretation of recommendations of the risk assessment and on the implementation of risk management strategies.

43. The reports of these capacity-building activities are available as information documents for consideration by the Parties (UNEP/CBD/BS/COP-MOP/5/INF/16 and 17).\(^{18}\)

IV. COLLABORATION IN IDENTIFYING LIVING MODIFIED ORGANISMS OR SPECIFIC TRAITS THAT MAY HAVE ADVERSE EFFECTS ON THE CONSERVATION AND SUSTAINABLE USE OF BIOLOGICAL DIVERSITY, TAKING ALSO INTO ACCOUNT RISKS TO HUMAN HEALTH

44. In a notification, the Executive Secretary invited Parties, other Governments and relevant organizations to submit scientifically sound information on the identification of living modified organisms or specific traits that may have adverse effects on the conservation and sustainable use of biological diversity, taking also into account risks to human health.\(^{19}\)

45. In some submissions received by the Secretariat, references were made to living modified organisms or specific traits that may have adverse effects such as living modified cotton, fish, maize, trees, viruses, as well as living modified organisms for production of pharmaceutical compounds, with stacked genes or traits, insect resistance, tolerance to abiotic stress and pesticides, modified nutrient uptake or harboring antibiotic resistance marker genes. Some submissions, on the other hand, noted that there is no science-based evidence pointing at potential adverse effects of living modified organisms commercialized to date.

46. On the basis of the submissions above, the Secretariat prepared a “Compilation of submissions on the identification of living modified organisms or specific traits that may have adverse effects on the conservation and sustainable use of biological diversity, taking also into account risks to human health” for consideration by the AHTEG and the Parties.\(^{20}\)

47. After deliberations on this issue, the AHTEG identified the following modalities for cooperation: (i) exchange of information via the Biosafety Clearing-House; (ii) workshops; (iii) an ad hoc technical expert group; and (iv) cooperation in the testing of living modified organisms.

48. A number of members of the AHTEG also agreed that a step-wise process could be established for this purpose, in which an initial phase of information gathering would be followed by a second phase for the analysis of the information.

49. The AHTEG made further specific recommendations regarding this issue as shown in paragraphs (f) and (g) (iv) of annex IV below.

V. IDENTIFICATION OF LIVING MODIFIED ORGANISMS THAT ARE NOT LIKELY TO HAVE ADVERSE EFFECTS ON THE CONSERVATION AND SUSTAINABLE USE OF BIOLOGICAL DIVERSITY, TAKING ALSO INTO ACCOUNT RISKS TO HUMAN HEALTH

50. Paragraph 4 of Article 7 to the Protocol states that “the advance informed agreement procedure shall not apply to the intentional transboundary movement of living modified organisms identified in a decision of the Conference of the Parties serving as the meeting of the Parties to this Protocol as being not likely to have adverse effects on the conservation and sustainable use of biological diversity, taking also into account risks to human health”.

---

51. In its deliberations on modalities that might enable the identification of living modified organisms that are not likely to have adverse effects on the conservation and sustainable use of biological diversity, taking also into account risks to human health, the Parties at their fifth meeting may take into consideration, *inter alia*, the following submissions made by Parties through the BCH under the simplified procedure (Article 13) in which the imports of living modified organisms were exempted from the advanced informed agreement procedure.  

21

52. As of 10 June 2010, the following living modified organisms were submitted to the BCH under the simplified procedure:

<table>

VI. CONCLUSIONS AND ELEMENTS OF A DRAFT DECISION

A. Further guidance on specific aspects of risk assessment

53. The tasks mandated by the Parties in the terms of reference for the Online Forum and AHTEG for the development of further guidance on risk assessment were successfully carried out through a process that included both online and face-to-face deliberations.

54. A large group of experts deliberated online through ad hoc discussion groups and real-time conferences and made recommendations to a smaller group, the AHTEG, that met face-to-face. This process enabled a large number of experts in various scientific and technical fields relevant to risk assessment to provide input into the development of the guidance material in a cost effective manner under the limited financial resources available.

21 Article 13, paragraph 1 (b).
55. An outcome of this process is a document entitled “Guidance on Risk Assessment of Living Modified Organisms”. The AHTEG and Online Forum recommended that this guidance document should be (i) published and distributed, including an online version under the BCH, in all United Nations languages; (ii) further tested for example during regional workshops including cooperation with existing initiatives for capacity-building and training, as appropriate; and (iii) revisited within two years and the need for an update of the list of background materials should be assessed within a year.

56. While significant progress towards addressing the need for guidance on risk assessment was made with the development of the document above, many members of the AHTEG and Online Forum were of the view that further development of guidance is still needed and therefore recommended that the process of combining an Online Forum and an AHTEG should be continued.

57. Based on the above information and taking into account, inter alia, the recommendations of the Online Forum and AHTEG, the Conference of the Parties serving as the meeting of the Parties to the Protocol may wish to:

(a) Support and endorse the continuation of the work of both the Open-ended Online Expert Forum and the AHTEG on Risk Assessment and Risk Management, to (i) develop additional guidance on specific types of living modified organisms and traits, taking into account, inter alia, the topics listed in annex V below; and (ii) revise the text of the “Guidance on Risk Assessment of Living Modified Organisms”, for instance, on the basis of the testing of the guidance during capacity-building activities, and update its lists of background materials;

(b) Request the Executive Secretary to: (i) publish and distribute it in all United Nations languages the document “Guidance on Risk Assessment of Living Modified Organisms”, including an online version on the Biosafety Clearing-House (BCH); (ii) test the guidance document during regional workshops including cooperation with existing initiatives for capacity-building and training, as appropriate; (iii) revise the common format for submission of records to the Biosafety Information Resources Centre (BIRC) of the BCH in order to link BIRC records on risk assessment to specific sections of the guidance document;

(c) Continue the discussions under the Open-ended Online Expert Forum on Risk Assessment and Risk Management and request the Executive Secretary to extend the invitation for additional experts;

(d) Establish an Ad Hoc Technical and Expert Group on Risk Assessment and Risk Management and request the Executive Secretary to apply the same modus operandi in the selection of experts as in the previous process.

B. Capacity-building in risk assessment

58. With regard to capacity-building, a training manual was developed in collaboration with some relevant UN organizations and international organizations. The manual was used as a basis for capacity-building activities that took place for the Pacific and Asia subregions. The participants of the workshop and training course made several recommendations with regards to improving the training manual for its usefulness and user friendliness. Furthermore, the participants recommended that the manual be developed as an interactive training material (e.g. CD-ROM), translated and distributed in all UN languages.
59. Based on the above information and taking into account, *inter alia*, the recommendations of the participants of the capacity-building activities, the Conference of the Parties serving as the meeting of the Parties to the Protocol may wish to:

(a) Request the Executive Secretary to convene, at the earliest convenient date and subject to the availability of funds, further regional or sub-regional training courses to enable countries to gain hands-on experience in the preparation and evaluation of risk assessment reports in accordance to the articles and Annex III of the Protocol;

(b) Further request the Executive Secretary, in cooperation with relevant United Nations and other organizations, to improve the usefulness of the training manual “Risk Assessment of Living Modified Organisms” by: (i) regularly revising it on the basis of the recommendations provided during the regional and sub-regional capacity-building activities; (ii) developing it into an interactive learning tool, such as a CD-ROM and make them available through the BCH; and (iii) publishing and distributing the manual to Parties, other Governments and relevant organizations.

C. **Identifying living modified organisms or specific traits that (i) may have or (ii) are not likely to have adverse effects on the conservation and sustainable use of biological diversity, taking also into account risks to human health**

60. Divergent views were expressed by Parties, other Governments and relevant organizations with regards to the identification of living modified organisms or specific traits that may have adverse effects on the conservation and sustainable use of biological diversity, taking also into account risks to human health. The AHTEG identified the following modalities for addressing the issue: (i) exchange of further information through the Biosafety Clearing-House; (ii) workshops; (iii) an ad hoc technical expert group; and (iv) cooperation in assessing potential adverse effects of living modified organisms. This process could be initiated in a stepwise manner by first phase of gathering information then followed by the analysis of the information.

61. With regard to the identification of living modified organisms that are not likely to have adverse effects on the conservation and sustainable use of biological diversity, taking also into account risks to human health, the Parties may take note, *inter alia*, of the decisions taken under the Simplified Procedure on imports of living modified organisms exempted from the advanced informed agreement procedure and submitted to the BCH.

62. Based on the above information and taking into account, *inter alia*, the views expressed by Parties, other Governments and relevant organizations and recommendations of the Open-ended Online Forum and AHTEG, the Conference of the Parties serving as the meeting of the Parties to the Protocol may wish to establish one or more mechanisms including, for instance, exchange of information, workshops and/or an expert group with the view to enabling Parties to take decisions on identifying living modified organisms or specific traits that (i) *may have* or (ii) *are not likely to have* adverse effects on the conservation and sustainable use of biological diversity, taking also into account risks to human health.

Annex III

GUIDANCE ON RISK ASSESSMENT OF LIVING MODIFIED ORGANISMS

This document was developed by the Ad Hoc Technical Expert Group (AHTEG) on Risk Assessment and Risk Management under the Cartagena Protocol on Biosafety.22

This is intended to be a “living document” that will be improved with time as new experience becomes available and new developments in the field of applications of living modified organisms (LMOs) occur, as and when mandated by the Parties to the Cartagena Protocol on Biosafety.

PART I:

ROADMAP FOR RISK ASSESSMENT OF LIVING MODIFIED ORGANISMS

This “Roadmap” provides an overview of the process of environmental risk assessment for a living modified organism (LMO) in accordance with Annex III23 to the Cartagena Protocol on Biosafety (hereinafter “the Protocol”) and all other articles related to risk assessment. This Roadmap was developed in response to decision BS-IV/1124 of the Conference of the Parties serving as the meeting of the Parties to the Protocol (COP-MOP). Annex III is the basis of the Roadmap. Accordingly, this Roadmap is a guidance document and does not replace Annex III. The overall aim of the Roadmap is facilitating and enhancing the effective use of Annex III by elaborating the technical and scientific process of how to apply the steps and points to consider in the process of risk assessment.

The purpose of this Roadmap is to provide further guidance on using Annex III with additional background material and links to useful references relevant to risk assessment. The Roadmap may be useful as a reference for risk assessors when conducting or reviewing risk assessments and in capacity-building activities.

The Roadmap applies to all types of LMOs25 and their intended uses within the scope and objective of the Protocol, and in accordance with Annex III. However, it has been developed based largely on living modified crop plants because of the extensive experience to date with environmental risk assessments for these organisms. It is intended to be a “living document” that will be modified and improved on over time as and when mandated by COP-MOP, and in the light of new experience, information and developments in the field of applications of LMOs, e.g. when other types of LMOs have been evaluated more extensively in environmental risk assessments.

---

22 The AHTEG on Risk Assessment and Risk Management was established by the Conference of the Parties serving as the meeting of the Parties to the Cartagena Protocol on Biosafety (COP-MOP) in its decision BS-IV/11. The terms of reference for the AHTEG as set out by the Parties may be found in the annex to decision BS-IV/11 (http://bch.cbd.int/protocol/decisions/decision.shtml?decisionID=11690).
25 Including products thereof, as described in paragraph 5 of Annex III to the Protocol.
INTRODUCTION

General introduction

Background

In accordance with the precautionary approach\(^{26}\) the objective of the Protocol is “to contribute to ensuring an adequate level of protection in the field of the safe transfer, handling and use of LMOs resulting from modern biotechnology that may have adverse effects on the conservation and sustainable use of biological diversity, taking also into account risks to human health, specifically focusing on transboundary movements”.\(^{27}\)

For this purpose, Parties shall ensure that risk assessments are carried out when making informed decisions regarding LMOs.

An LMO and its use may have several effects, which may be intended or unintended, taking into account that some unintended effects may be predictable. The objective of risk assessment is to identify and evaluate the potential adverse effects of LMOs on the conservation and sustainable use of biological diversity in the likely potential receiving environment, taking also into account risks to human health.\(^{28}\)

The risk assessment is performed on a case-by-case basis. What is considered an adverse effect depends on protection goals and assessment end-points taken into consideration when scoping the risk assessment. The choice of protection goals by the Party could be informed by Articles 7(a), 7(b) and 8(g) and Annex I of the Convention on Biological Diversity.

According to the general principles of Annex III of the Protocol, risk assessments shall be based, at a minimum, on information provided in accordance with Article 8 and other available scientific evidence in order to identify and evaluate the possible adverse effects of LMOs on the conservation and sustainable use of biological diversity, taking also into account risks to human health.\(^{29}\)

Annex III states that “risk assessment should be carried out in a scientifically sound and transparent manner, and can take into account expert advice of, and guidelines developed by, relevant international organizations. Lack of scientific knowledge or scientific consensus should not necessarily be interpreted as indicating a particular level of risk, an absence of risk, or an acceptable risk. (…) Risk assessment should be carried out on a case-by-case basis. The required information may vary in nature and level of detail from case to case, depending on the LMO concerned, its intended use and the likely potential receiving environment”.\(^{30}\)

The risk assessment process

Risk assessment is a structured process. Paragraph 8 of Annex III provides a description of the key steps of the risk assessment process to identify and evaluate the potential adverse effects and manage risks.

\(^{26}\) “In order to protect the environment, the precautionary approach shall be widely applied by States according to their capabilities. Where there are threats of serious or irreversible damage, lack of full scientific certainty shall not be used as a reason for postponing cost-effective measures to prevent environmental degradation” (Principle 15 of the Rio Declaration on Environment and Development) at: (http://www.unep.org/Documents.Multilingual/Default.asp?DocumentID=78&ArticleID=1163), and in line with Articles 10.6 and 11.8 of the Protocol.

\(^{27}\) http://www.cbd.int/biosafety/articles.shtml?a=cpb-01.

\(^{28}\) Annex III, paragraph 1.

\(^{29}\) Article 15, paragraph 1.

\(^{30}\) Annex III, paragraphs 3, 4 and 6.
Paragraph 9 describes, depending on the case, points to consider in this process. The steps describe an integrated process whereby the results of one step may be relevant to other steps. Also, risk assessment may need to be conducted in an iterative manner, where certain steps may be repeated or re-examined to increase or re-evaluate the confidence in the conclusions of the risk assessment. When new information arises that could change its conclusions, the risk assessment may need to be re-examined accordingly. Similarly, the issues mentioned in the ‘overarching issues’ section below can be taken into consideration again at the end of the risk assessment process to determine whether the objectives and criteria that were set out at the beginning of the risk assessment have been met.

Risk assessment is done in a comparative manner, meaning that risks associated with living modified organisms should be considered in the context of the risks posed by the non-modified recipient organism in the likely potential receiving environment. Additionally, experience with the same, or, as appropriate, similar, genotypic or phenotypic characteristics may be taken into consideration along with the non-modified recipient organism in the risk assessment of an LMO. For instance, the comparison with the (near-)isogenic or closely related non-modified recipient is used in step 1 of the risk assessment (see below) where the novel genotypic or phenotypic characteristics associated with the LMO are identified. But when the potential consequences of adverse effects are evaluated, broader experience, such as mentioned in step 3 (a), may be taken into account, when establishing a baseline. Results from experimental field trials or other environmental information and experience with the same LMO may be taken into account as information elements in a new risk assessment for that LMO. In all cases where information, including baseline data, is derived from other sources, it is important to establish the validity and relevance of the information for the risk assessment. For instance, it should be taken into account that the behavior of a transgene, as that of any other gene, may vary because it depends on the genetic and physiological background of the recipient as well as on the ecological characteristics of the environment that the LMO is introduced into.

The concluding recommendations derived from the risk assessment in step 5 are required to be taken into account in the decision-making process on an LMO. In the decision-making process, other Articles of the Protocol or other relevant issues may also be taken into account and are addressed in the last paragraph of this Roadmap: ‘Related Issues’.

A flowchart illustrating the risk assessment process according to this Roadmap is annexed hereto. *(See references relevant to “General Introduction”).*

**Overarching issues in the risk assessment process**

There are some overarching issues to consider in the design/planning phase of the risk assessment process to ensure the quality and relevance of the information used. These entail, among others:

- Setting criteria for relevancy in the context of a risk assessment – e.g. data may be considered relevant if they can affect the outcome of the risk assessment.
- Establishment of scientifically robust criteria for the inclusion of scientific information.
  - Data should be of an acceptable scientific quality. Data quality should be consistent with the accepted practices of scientific evidence-gathering and reporting and may include

---

31 Annex III, paragraph 5.
32 For the purpose of this document, a transgene is a nucleic acid sequence in an LMO that results from the application of modern biotechnology as described in Article 3 (i) (a) of the Protocol.
independent review of the methods and designs of studies. Data may be derived from a variety of sources, e.g. new experimental data as well as data from relevant peer reviewed scientific literature.

- Sound science is based on transparency, verifiability, and reproducibility (e.g. reporting of methods and data in sufficient detail, so that the resulting data and information could be confirmed independently), and on the accessibility of data (e.g. the availability of relevant, required data or information or, if requested and as appropriate, of sample material), taking into account the provisions of Article 21 of the Protocol on the confidentiality of information. The provisions of sound science serve to ensure and verify that the risk assessment is carried out in a scientifically sound and transparent manner.

- Identification and consideration of uncertainty.

According to the Protocol, “where there is uncertainty regarding the level of risk, it may be addressed by requesting further information on the specific issues of concern or by implementing appropriate risk management strategies and/or monitoring the living modified organism in the receiving environment”.

Uncertainty is inherent in the concept of risk. To date, “there is no internationally agreed definition of ‘scientific uncertainty’, nor are there internationally agreed general rules or guidelines to determine its occurrence. Those matters are thus dealt with – sometimes differently – in each international instrument incorporating precautionary measures”.

It should be kept in mind that uncertainty cannot always be reduced by providing additional information. For example, new uncertainties may arise as a result of the provision of additional information.

Considerations of uncertainty strengthen the confidence and scientific soundness of a risk assessment. In communicating the results of a risk assessment, it is important to consider and analyze in a systematic way the various forms of uncertainty that can arise at each step and in combination at step 4 of the Roadmap. An analysis of uncertainty includes considerations of its source and nature.

The source(s) of uncertainty may stem from the data/information itself and/or the choice of study design including the methods used, and the analysis of the information.

The nature of uncertainty may be described for each identified source of uncertainty arising from: (i) imperfect knowledge or lack of available information, which may be reduced with more research/information, and (ii) inherent variability.

33 Annex III, paragraph 8 (f).
35 Article 10, paragraph 6, of the Protocol: “Lack of scientific certainty due to insufficient relevant scientific information and knowledge regarding the extent of the potential adverse effects of a living modified organism on the conservation and sustainable use of biological diversity in the Party of import, taking also into account risks to human health, shall not prevent that Party from taking a decision, as appropriate, with regard to the import of that living modified organism intended for direct use as food or feed, or for processing, in order to avoid or minimize such potential adverse effects.”
Context and scoping of the risk assessment

In setting the context and scope for a risk assessment, a number of aspects should be taken into consideration, as appropriate, that are specific to the Party involved and to the specific case of risk assessment. These aspects include:

- Existing policies and strategies based on, for instance, regulations and the international obligations of the Party involved; (ii) Guidelines or regulatory frameworks that the Party has adopted; and (iii) Protection goals, assessment end-points, risk thresholds and management strategies. Setting the context and scope for a risk assessment that are consistent with these policies, strategies and protection goals may involve a process that includes risk assessors, decision-makers and various stakeholders prior to conducting the actual risk assessment;

- (i) Framing the risk assessment process; (ii) Taking into account the expected (potential) conditions of handling and use of the LMO; (iii) Taking into account customary practices and habits that could affect the protection goals or end-points; identification of relevant questions to be asked for that purpose;

- Identification of methodological and analytical requirements, including any reviewing mechanisms, that is required to achieve the objective of the risk assessment as laid down, for instance, in guidelines published or adopted by the Party that is responsible for conducting the risk assessment (i.e. typically the Party of import according to the Protocol);

- The nature and level of detail of the information required may depend on the intended use of the LMO and the likely potential receiving environment. For small scale field releases, especially at early experimental stages, less information may be available compared to the information available for large scale environmental release, and for commercial scale planting;

- Experience and history of use of the non-modified recipient, taking into account its ecological function;\(^36\) and

- Establishing criteria for describing the level of the (potential) environmental adverse effects of LMOs, as well as criteria for the terms that are used to describe the levels of likelihood (step 2), the magnitude of consequences (step 3) and risks (step 4) and the manageability of risks (step 5; see risk assessment steps below).

(See references relevant to “Identification and consideration of uncertainty”).

THE RISK ASSESSMENT

To fulfill its objective under Annex III, as well as other relevant Articles of the Protocol, risk assessment is performed in five steps, as appropriate. These five steps are indicated in Paragraph 8 (a)-(e) of Annex III and also detailed below. Their titles have been taken directly from the paragraphs 8 (a)-(e) of Annex III.

\(^36\) The term “ecological function” (or: “ecological services”) provided by an organism refers to the role of the organism in ecological processes. Which ecological functions or services are taken into account here will be dependent on the protection goals set for the risk assessment. For example, organisms may be part of the decomposer network playing an important role in nutrient cycling in soils or be important as a pollen source for pollinators and pollen feeders.

/...
For each step a rationale and points to consider are provided. Some points to consider are taken from paragraph 9 of Annex III, whereas others have been added based on generally accepted methodology of LMO risk assessment and risk management. The relevance of each point to consider will depend on the case being analyzed.

(See references relevant to “Risk Assessment in general”).

Step 1: “An identification of any novel genotypic and phenotypic characteristics associated with the living modified organism that may have adverse effects on biological diversity in the likely potential receiving environment, taking also into account risks to human health.”

**Rationale:**

The purpose of this step is to identify biological changes resulting from the genetic modification(s), including any deletions, compared to the non-modified organism, and identify what, if any, changes could cause adverse effects on the conservation and sustainable use of biological diversity, taking also into account risks to human health. This step is similar to the ‘hazard identification step’ in other risk assessment guidance. The comparison of the LMO is performed with the non-modified recipient, or a (near-)isogenic line or, as appropriate, with a non-modified organism of the same species, taking into consideration the new trait(s) of the LMO.

In this step, scientifically plausible scenarios are identified in which novel characteristics of the LMO could give rise to adverse effects in an interaction with the likely potential receiving environment. The novel characteristics of the LMO to be considered can be genotypic or phenotypic, biological. They may be intended or unintended, predicted or unpredicted. The points to consider below provide information elements on which hazard identification can be built.

The type and level of detail of the information required in this step may vary from case to case depending on the nature of the modification of the LMO and on the scale of the intended use of the LMO. For small scale field releases, especially at early experimental stages, less information may be available and some of the resulting uncertainty may typically be addressed by risk management measures (see step 5).

**Points to consider regarding the characterization of the LMO:**

(a) Relevant characteristics of the non-modified recipient (e.g. (i) its biological characteristics, in particular those that, if changed, or interacting with the new gene products or traits of the LMO, could cause changes in the behavior of the non-modified recipient in the environment in a way that may cause adverse effects; (ii) its taxonomic relationships, (iii) its origin, centers of origin and centers of genetic diversity); (iv) ecological function, and (v) as a component of biological diversity that is important for the conservation and sustainable use of the biological diversity in the context of Article 7(a) and Annex I of the Convention;

(b) Relevant characteristics of the genes and of other functional sequences, such as promoters, that have been inserted into the LMO (e.g. functions of the gene and its gene product in the donor organism with particular attention to characteristics that could cause adverse effects in the recipient);

(c) Molecular characteristics of the LMO related to the modification (e.g. (a) characteristics of the insert(s) which may include (i) gene products (intended and unintended), (ii) levels of expression, (iii) functions, (iv) insertion site in the genome of the recipient and any effects of

---

37 The bold printed headings of each step are direct quotes from Annex III of the Protocol.
insertion, (v) stability or integrity within the genome of the recipient; (b) (i) the transformation method, (ii) the characteristics of the vector if and, as far as it is present in the LMO, including its identity, source or origin and host range) with particular attention paid to any characteristics that are related to potential adverse effects. The availability and relevance of this information may vary according to the type of application. Characteristics related to adverse effects may also result from changed expression levels of endogenous genes due to effects of a transgene or from combinatorial effects.\(^{38}\)

(d) Consideration of genotypic (see point to consider (c) above) and phenotypic, biological changes in the LMO, either intended or unintended, in comparison with the non-modified recipient, considering those changes that could cause adverse effects. These may include changes at the transcriptional and translational level and may be due to the insert itself or to genomic changes due to the transformation or recombination processes.

Point to consider regarding the receiving environment:

(e) Characteristics of the likely potential receiving environment, in particular its attributes that are relevant to potential interactions of the LMO that could lead to adverse effects (see also paragraph (g) below),\(^{39}\) taking into account the characteristics that are components of biological diversity;

(f) The intended scale and duration of the environmental release.

Points to consider regarding the potential adverse effects resulting from the interaction between the LMO and the receiving environment:

(g) Characteristics of the LMO in relation to the receiving environment (e.g. information on phenotypic traits that are relevant for its survival in, or its potential adverse effects on the likely receiving environment – see also paragraph (e) above);

(h) Considerations for unmanaged and managed ecosystems (such as agricultural, forest and aquaculture systems) that are relevant for the likely potential receiving environment. These include the potential for dispersal of the LMO through, for instance, seed dispersal or outcrossing within or between species, or through transfer into habitats where the LMO may persist or proliferate;

(i) Potential consequences of outcrossing and flow of transgenes from an LMO to other sexually compatible species, which could lead to introgression of the transgene(s) into the population of sexually compatible species;

(j) Effects on non-target organisms;

\(^{38}\) For the purpose of this document, the term “combinatorial effects” refers to effects that may arise from the interactions between two (or more) genes. The effects may occur at the level of gene expression, or through interactions between RNA, or among gene products. The effects may be qualitative or quantitative; quantitative effects are often referred to as resulting in antagonistic, additive or synergistic effects.

\(^{39}\) Examples of relevant attributes of the receiving environment include, among others: (i) ecosystem type (e.g., agroecosystem, horticultural or forest ecosystems, soil or aquatic ecosystems, urban or rural environments); (ii) extension of dimension (small, medium, large or mixed scale); (iii) previous use/history (intensive or extensive use for agronomic purposes, natural ecosystem, or no prior managed use in the ecosystem); (iv) the geographical zone(s) in which the release is intended, including climatic and geographic conditions and the properties of soil, water and/or sediment; (v) specific characteristics of the prevailing fauna, floral and microbial communities including information on sexually compatible wild or cultivated species; and (vi) biodiversity status, including the status as centre of origin and diversity of the recipient organism and the occurrence of rare, endangered, protected species and/or species of cultural value.
Cumulative effects;\textsuperscript{40}

Effects of the incidental exposure of humans to (parts of) the LMO (e.g. exposure to pollen), and the toxic or allergenic effects that may ensue;

Potential adverse effects as a consequence of horizontal gene transfer (HGT) of transgenic sequences from the LMO to any other organism in the likely receiving environment. With regard to HGT to micro-organisms (including viruses), particular attention may be given to cases where the LMO is also a micro-organism; and

A consideration of uncertainty arising in step 1 that may significantly impact the identification of hazards in this step (see “Identification and consideration of uncertainty” under Context and scoping of the risk assessment above).

(See references relevant to “Step 1”).

\textbf{Step 2: “An evaluation of the likelihood of adverse effects being realized, taking into account the level and kind of exposure of the likely potential receiving environment to the living modified organism.”}

\textit{Rationale:}

The potential adverse effects identified in step 1 may result in risks, but this depends on the likelihood and the consequence of the effects. In order to determine and characterize the overall risk (in step 4), the likelihood of each adverse effect being realized has to be assessed and evaluated beforehand.

One aspect to be considered is whether the receiving environment will be exposed to the LMO in such a way that the identified adverse effects may actually occur, e.g. taking into consideration the intended use of the LMO, and the expression level, dose and environmental fate of transgene products as well as plausible pathways leading to adverse effects.

Other aspects to be considered here are (i) the potential of the LMO (or its derivatives resulting from outcrossing) to spread and establish beyond the receiving environment (in particular into protected areas), and whether that could result in adverse effects; and (ii) the possibility of occurrence of adverse (e.g. toxic) effects on organisms (or on organisms other than the ‘target organism’ for some types of LMOs).

The levels of likelihood may be expressed, for example, by the terms ‘highly likely’, ‘likely’, ‘unlikely’, ‘highly unlikely’. Parties may consider describing these terms and their uses in risk assessment guidelines published and/or adopted by them.

\textit{Points to consider:}

Information relating to the type and intended use of the LMO, including the scale and duration of the release, bearing in mind, as appropriate, user habits, patterns and agronomic practices;

The relevant characteristics of the likely potential receiving environment that may experience or may be a factor in the occurrence of the potential adverse effects (see also step 1 (e), (f) and (g)), taking into account the variability of the environmental conditions and any long-term adverse effects. Levels of expression in the LMO and persistence and accumulation in the

\textsuperscript{40} For the purpose of this document, the term “cumulative effects” refers to effects that occur due to the presence of multiple LMOs in the receiving environment.
environment (e.g. in the food chain) of substances with potentially adverse effects newly produced by the LMO, such as insecticidal proteins, toxins and allergens;

(c) Available information on the location of the release and the receiving environment (such as geographic and biogeographic information, including, as appropriate, coordinates, information on the sexually compatible species and whether they are co-localized with the LMO and whether flowering occurs at the same time, or in general, interbreeding can occur);

(d) For the case of outcrossing and outbreeding from an LMO to sexually compatible species, the considerations would include: (i) the biology of the sexually compatible species; (ii) the potential environment where the sexually compatible species may be located; (iii) the chance of introgression of the transgene into the sexually compatible species;

(e) Expected exposure to the environment where the LMO is released and means by which incidental exposure could occur at that location or elsewhere (e.g. gene flow or incidental exposure due to losses during transport and handling);

(f) A consideration of uncertainty arising in step 2 (see “Identification and consideration of uncertainty” under “Context and scoping of the risk assessment” above).

(See references relevant to “Step 2”).

Step 3: “An evaluation of the consequences should these adverse effects be realized.”

Rationale:

This step describes an evaluation of the magnitude of the consequences in the likely potential receiving environment, taking into account, among others, results of tests done under different conditions such as laboratory experiments or experimental field releases. The evaluation is comparative and should be considered in the context of the adverse effects caused by the non-modified recipient or, if more appropriate, by a near-isogenic or other non-modified organism of the same species. The evaluation may also be considered in the context of the adverse effects that occur in the environment and which are associated with existing practices such as various agronomic practices, for example, for pest or weed management if such information is available and relevant. The evaluation of the consequence of adverse effects may be expressed as, for instance, ‘major’, ‘intermediate’, ‘minor’ or ‘marginal’. Parties may consider describing these terms and their uses in risk assessment guidelines published and/or adopted by them.

Points to consider:

(a) Relevant experience with the consequences of existing practices with the non-modified recipient or, if more appropriate, with a non-modified organism of the same species in the likely potential receiving environment, may be useful in order to establish baselines to evaluate, for example, the consequences of (i) agricultural practices, such as the level of inter- and intra-species gene flow, dissemination of the recipient, abundance of volunteer plants in crop rotation; occurrence of pests and/or beneficial organisms such as pollinators and pest predators; or (ii) pest management, including effects on non-target organisms in pesticide applications while following accepted agronomic practices;

(b) Adverse effects which may be direct and indirect, immediate and delayed. Some of these adverse effects may result from combinatorial and cumulative effects;

(c) Results from laboratory experiments examining, inter alia, dose-response relationships (e.g., EC 50s, LD 50s) and from field trials evaluating, for instance, potential invasiveness;
For the case of outcrossing to sexually compatible species, the possible adverse effects that may occur, after introgression, due to the expression of the transgenes in the sexually compatible species; and

A consideration of uncertainty arising in step 3 that may significantly impact the evaluation of consequences should the adverse effects be realized (see “Identification and consideration of uncertainty” under Context and scoping of the risk assessment above).

(See references relevant to “Step 3”).

Step 4: “An estimation of the overall risk posed by the living modified organism based on the evaluation of the likelihood and consequences of the identified adverse effects being realized.”

Rationale:

The purpose of this step is to determine and characterize the level of the overall risk based on the identified individual risks posed by the LMO on the conservation and sustainable use of biological diversity, taking also into account human health. The individual risks are determined on the basis of an analysis of the potential adverse effects identified in step 1, their likelihood (step 2) and consequences (step 3), and also taking into consideration any relevant uncertainty that emerged in the preceding steps.

It should then be determined whether the assessed risks meet the criteria set out in the protection goals, assessment endpoints and thresholds, as established in relevant legislation of the Party or in its practice. Where there is uncertainty regarding the level of risk, it may be addressed by requesting further information on the specific issues of concern or by implementing appropriate risk management strategies and/or monitoring the LMO in the receiving environment (see also step 5). Description of the risk characterization may be expressed as, for instance, ‘high’, ‘medium’, ‘low’, ‘negligible’ or ‘indeterminate due to uncertainty or lack of knowledge’. Parties may consider describing these terms and their uses in risk assessment guidelines published and/or adopted by them.

To date, there is no universally accepted method to estimate the overall risk but rather a number of methods are available for this purpose. The outcome of this step may be, for example, a description explaining how the estimation of the overall risk was performed.

Points to consider:

(a) The identified potential adverse effects (step 1);
(b) The assessments of likelihood (step 2);
(c) The evaluation of the consequences (step 3);
(d) Any interaction between the identified individual risks;
(e) Any cumulative effect due to the presence of multiple LMOs in the receiving environment; and
(f) A consideration of uncertainty arising in this and the previous steps (see “Identification and consideration of uncertainty” under Context and scoping of the risk assessment above).

(See references relevant to “Step 4”).
Step 5: “A recommendation as to whether or not the risks are acceptable or manageable, including, where necessary, identification of strategies to manage these risks”

Rationale:

In this way, step 5 provides an interface between the process of risk assessment and the process of determining whether risk management measures are necessary and, if so, which measures could be implemented to manage the risks associated with the LMO.

The evaluation of the overall risk on the basis of the identified individual risks conducted in the previous step may lead to the conclusion that the identified risks are not acceptable in relation to the established protection goals, assessment end-points and risk thresholds, also when taking into account risks posed by the non-modified recipient and its use. Then the question arises whether risk management options can be identified that have the potential to remove the identified risks or reduce their magnitude. In the process of the formulation of risk management options, the effect of the proposed options on the identified risks should be explained. The appropriate steps of the risk assessment should then be reiterated by taking into account the implementation of the risk management options to estimate the new levels of likelihood, consequence and risk and to assess if the risk management measures are appropriate and sufficient.

The issues mentioned in the ‘overarching issues’ section can be taken into consideration again at the end of the risk assessment process to evaluate whether the objectives and criteria that were set out at the beginning of the risk assessment have been met.

The recommendation of acceptability of risk(s) should acknowledge the previously identified uncertainties. Some uncertainties may be reduced by monitoring (e.g. checking the validity of assumptions about the ecological effects of the LMO), requests for more information, or implementing the appropriate risk management options.

The recommendation(s) as to whether or not the risks are acceptable or manageable and recommendations for risk management options are submitted for consideration in the decision-making process.

Points to consider related to the acceptability of risks:

(a) The criteria for the establishment of acceptable/unacceptable levels of risk, including those set out in national legislation or guidelines, as well as the protection goals of the Party, as identified when setting the context and scope for a risk assessment;

(b) In establishing a baseline for the comparison of the LMO, any relevant experience with the use of the non-modified recipient, and practices associated with its use in the potential receiving environment; and

(c) The feasibility of the adoption of risk management or monitoring strategies.

Points to consider related to the risk management strategies:

(d) Existing management practices, if applicable, that are in use for the non-modified recipient organism or for other organisms that require comparable risk management and that might be appropriate for the LMO being assessed, e.g. isolation distances to reduce outcrossing potential of the LMO, modifications in herbicide or pesticide management, crop rotation, soil tillage, etc.;
(e) Methods to detect and identify the LMO and their specificity, sensitivity and reliability in the context of environmental monitoring (e.g. monitoring for short- and long-term, immediate and delayed effects; specific monitoring on the basis of scientific hypotheses and supposed cause/effect relationship as well as general monitoring) including plans for appropriate contingency measures to be applied in case the results from monitoring call for them;

(f) Management options in the context of the intended use (e.g. mitigating the effect of an LMO producing insecticidal proteins by the use of refuge areas to minimize the development of resistance against these proteins).

(See references relevant to “Step 5”).

RELATED ISSUES

Some members of the AHTEG considered some issues to be related to risk assessment and decision-making process but outside the scope of this Roadmap. These issues were, *inter alia*:

- Risk management (Article 16);
- Capacity-building (Article 22);
- Public awareness and participation (Article 23);
- Socio-economic considerations (Article 26);
- Liability and redress (Article 27);
- Co-existence;
- Ethical issues.
Figure 1. The Roadmap for Risk Assessment. The flowchart represents the steps to identify and evaluate the potential adverse effects of LMOs on the conservation and sustainable use of biological diversity in the likely potential receiving environment, taking also into account risks to human health. The box around steps 2 and 3 shows that these steps may sometimes be considered simultaneously or in reverse order.
PART II

SPECIFIC TYPES OF LMOs AND TRAITS

A. RISK ASSESSMENT OF LIVING MODIFIED ORGANISMS WITH STACKED GENES OR TRAITS

INTRODUCTION

Worldwide, a growing number of LMOs with stacked transgenic traits, particularly LM crops, are being developed for commercial uses. As a result, the number of stacked genes in a single LMO and the number of LMOs with two or more transgenic traits is growing.

Stacked transgenic traits can be produced through different approaches. In addition to the cross-hybridising of two LMOs, multiple trait characters can be achieved by transformation with a multigene cassette, retransformation of an LMO or simultaneous transformation with different transgene cassettes (i.e., cotransformation).

This guidance document focuses on stacked transgenic traits that have been produced through cross-breeding of two or more LMOs.

LMOs with multiple transgenic traits resulting from re-transformation, co-transformation or transformation with a multigene cassette should be assessed according to the Roadmap.

This guidance document complements the Roadmap for Risk Assessment developed by the AHTEG on Risk Assessment and Risk Management, and focuses on issues that are of particular relevance to the risk assessment of LMOs with stacked events generated through cross breeding of single or multiple event LMO.

This is intended to be a “living document” that will be shaped and improved with time as new information and/or experience becomes available and new developments in the field of applications of LMOs occur, as and when mandated by the Parties to the Protocol.

OBJECTIVE

The objective of this document is to give additional guidance on the risk assessment (RA) of LMOs with stacked events generated through conventional crossing of single or multiple event LMOs. Accordingly, it is meant to complement the Roadmap for Risk Assessment\(^{41}\) and address special aspects of LMOs with stacked transgenes/traits resulting from the conventional crossing. For the time being it will be restricted to plant LMOs.\(^{42}\)

\(^{41}\) In accordance with a mandate from the Parties to the Cartagena Protocol on Biosafety (the Protocol), the AHTEG has developed ‘a “roadmap”, such as a flowchart, on the necessary steps to conduct a risk assessment in accordance with Annex III to the Protocol and, for each of these steps,’ has provided ‘examples of relevant guidance documents’. The Roadmap is presented, together with the present document, to the Parties of the Protocol on the occasion of the fifth meeting of the Conference of the Parties serving as the meeting of the Parties.

\(^{42}\) It is also restricted to those LMO generated through the methods of Modern Biotechnology as defined in Art. 3 (i) (a) of the Protocol. LMOs derived from fusion of cells are not covered in this document.

/…
USE OF TERMS

Transformation event (TraEv)

For the purpose of this document, a transformation event (TraEv) is an LM plant which results from the use of modern biotechnology applying *in vitro* nucleic acid techniques that may involve, but is not limited to, single or multiple gene transformation cassettes. In either case, the result will be one transformation event.

Stacked event (StaEv)

For the purpose of this document, a stacked event (StaEv) is an LM plant generated through conventional cross breeding of two or more single parental transformation events (TraEvs) or two already stacked events. Accordingly the transgene cassettes may be physically unlinked (i.e. located separately in the genome) and may segregate independently.

Unintentional stacked event

Unintentional stacked events are the result of outcrossing of stacked events into other LMOs or compatible relatives in the receiving environment. Depending on the segregation pattern of the stacked genes this may result in new and/or different combinations of TraEvs.

SCOPE

This guidance document focuses on stacked events (StaEv) resulting from conventional crossings between two or more single transformation events (TraEv) as parental lines so that the resulting LMO contains two or more transgenic traits. It is understood that the individual TraEvs making up the StaEv have been assessed previously in accordance with Annex III of the Cartagena Protocol on Biosafety and as described in the Roadmap.

ISSUES TO BE CONSIDERED IN THE RISK ASSESSMENT

Assessment of sequence characteristics at the insertion sites and genotypic stability (see step 1, Point to consider (c) of the Roadmap for Risk Assessment)

Rationale:

Although recombination, mutation and rearrangements are not limited to LMOs, the combination of transgenic traits via cross breeding may further change the molecular characteristics of the inserted genes/gene fragments at the insertion site and/or influence the regulation of the expression of the transgenes. In addition, changes to the molecular characteristics may influence the ability to detect the LMO, which may be needed in the context of risk management measures (see step 5 of the Roadmap. The reappraisal of the molecular sequence at the insertion sites, and the intactness of the transgenes may be confirmative to the molecular characteristics of the parental LMOs, but may also be a basis for assessing any intended or unintended possibly adverse effects on the conservation and sustainable use of biological diversity in the likely potential receiving environment and of potential adverse effects on human health. The extent of the reexamination may vary case by case and take into account the results of the parental LMO risk assessment.

See Article 3 (i) (a) of the Protocol.

For the purpose of this document, a transgene is a nucleic acid sequence that results from the application of modern biotechnology as described in Article 3 (i) (a) of the Protocol.
Assessment of potential interactions between combined events and the resulting phenotypic effects
(see step 1, point to consider (d) of the Roadmap for Risk Assessment)

Rationale:

The combination of two or more TraEvS resulting in a StaEv may influence the expression level of each
of the transgenes and there may be interaction between the genes and the expressed products of the
different transgenes. In addition, the stacked transgenes may alter the expression of endogenous genes.

Therefore, in addition to information about the characteristics of the parental single-TraEv LMOs,
specific information on potential for interactions between the altered or inserted genes, stacked proteins
or modified traits and endogenous genes and their products in the StaEv LMO should be considered and
assessed. For example, it should be assessed whether the different transgenes affect the same biochemical
pathways or physiological processes, or are expected to or may have any combinatorial effects that may
result in potential for new or increased adverse effects relative to the parent LMOs.

Assessment of combinatorial and cumulative effects of stacked event LMOs on the conservation
and sustainable use of biological diversity in the likely potential receiving environment, taking also
into account potential adverse effects to human health (see step 1, point to consider (c), step 2, point
to consider (c) and step 3, point to consider (b) of the Roadmap for Risk Assessment)

Rationale:

Assessment of combinatorial and cumulative effects\(^{45}\) is based on the environmental risk assessment data
for the StaEv LMO in comparison to the closely related non-modified recipient species and the parent
LMOs in the likely receiving environment, taking into consideration the results of the genotypic and
phenotypic assessments outlined above.

If potential new or increased adverse effects on the conservation and sustainable use of biological
diversity or on human health are identified in relation to the StaEv through the above analysis of possible
interactions, additional supporting data on StaEv may be required, such as:

(a) Phenotypic characteristics, including the levels of expression of any introduced gene
products or modified traits, compared to the parent LMOs and to relevant non-modified
recipient organisms (plants);

(b) Compositional analysis (e.g. levels of expression in the LMO and persistence and
accumulation in the environment, such as in the food chain) of substances with
potentially harmful effects newly produced by the StaEv, (e.g. insecticidal proteins,
allergens, anti-nutritional factors, etc.) in amounts that differ from those produced by the
parental LMOs or non-modified recipient organisms;

(c) Additional information depending on the nature of the combined traits. For example,
further toxicological analysis of the StaEv may be required to address any combinatorial
effects arising from the stacking of two or more insecticidal traits that result in a
broadened target range or increased toxicity.

Also, indirect effects due to changed agricultural management procedures, combined with the use of the
transgenic stacked event LMO, should be taken into consideration.

\(^{45}\) See definition of combinatorial and cumulative effects in the Roadmap (footnotes 38 and 40, respectively).
Intentional and unintentional StaEvS may have altered environmental impacts as a result of cumulative
and combinatorial effects of the stacked traits prevalent in different LMOs of the same species in the
receiving environment. Unintentional StaEvS may arise from outcrossing with other LMOs of the same
species or cross-compatible relatives (see “Use of terms”). If a number of different StaEvS are cultivated
in the same environment a number of varying unintentional StaEvS may occur. Changed impacts on non-
target organisms or a change in the range of non-target organisms in the likely receiving environment
should be taken into account.

Development of specific methods for distinguishing the combined transgenes in a stacked event
from the parental LMOs (see step 5, point to consider (d) of the Roadmap for Risk Assessment)

Rationale:

Some of the risk management strategies for StaEvS may involve methods for the detection and
identification of these LMOs in the context of environmental monitoring. Currently, many detection
methods for LMOs rely on DNA-based techniques, such as polymerase chain reaction (PCR) or protein
based ELISA tests targeted to single transformation events. The methods used to detect the transgene in
the parental lines may not be sensitive or specific enough to differentiate between single parental
transformation events and the same event being part of a stacked event. A special problem may arise
particularly in the cases where the StaEv contains multiple transgenes with similar DNA sequences.
Therefore, the detection of each and all individual transgenes in a StaEv may become a challenge and
need special consideration.

B. RISK ASSESSMENT OF LIVING MODIFIED CROPS WITH TOLERANCE TO ABIOTIC STRESS

INTRODUCTION

The aim of this document is to provide further guidance for the risk assessment of living modified (LM) crops with improved tolerance to abiotic stress.

This guidance document should be considered in the context of the Cartagena Protocol on Biosafety. The elements of Articles 15 Annex III of the Protocol also apply to LM crops with tolerance to abiotic stress. Accordingly, the methodology and points to consider contained in Annex III are also applicable to this type of LMO.

The potential environmental adverse effects of an LM crop with abiotic stress tolerance depends on (i) the receiving environment; (ii) the modified crop, (iii) phenotypic changes resulting from the genotypic changes made to the plant and (iv) its intended use. A risk assessment would be performed on a case-by-case basis in accordance with Annex III of the Protocol.

This guidance document complements the Roadmap for Risk Assessment developed by the AHTEG on Risk Assessment and Risk Management, and focuses on issues that are of particular relevance to the risk assessment of LM crops tolerant to abiotic stress.

USE OF TERMS

“Abiotic stresses” are environmental conditions caused by non-living factors that are detrimental or suboptimal to the growth, development and/or reproduction of a living organism. Types of abiotic stresses include, for example, drought, salinity, cold, heat, soil pollution and air pollution (e.g., nitrous oxides, ozone).

RISK ASSESSMENT

While the same general principles used in the risk assessments of other types of LMOs also apply to LM crops with increased tolerance to abiotic stress, there are a number of specific issues that may be of particular importance when assessing the risks of LM crops tolerant to abiotic stresses.

Questions that may be relevant to the risk assessment of LM crops with tolerance to abiotic stress in connection with the intended use and receiving environment include:

- Would the tolerance trait have the potential to increase the invasiveness, persistence or weediness of the LM crop that causes adverse effects to other organisms?
- Would a LM plant expressing tolerance to a particular abiotic stress have other advantages in the targeted receiving environment that cause adverse effects?
- Would any LMO arising from outcrossing with the abiotic stress tolerant LM crop, have the potential to colonize an ecosystem beyond the targeted receiving environment?
- Would the abiotic stress tolerance trait, for example, via pleitropic effects, have the potential to affect, inter alia, pest and disease resistance mechanisms of the LM crop?

46 Paragraphs 8 and 9 of Annex III, respectively.

/...
Some of the potential adverse effects to be evaluated in the risk assessment, from the introduction of crops tolerant to abiotic stress into the environment include, for example: a) increased selective advantage(s) other than the intended tolerance trait; b) increased persistence in agricultural areas and increased invasiveness in natural habitats; c) adverse effects on organisms exposed to the crop; and d) consequences of potential gene flow to wild or conventional relatives. While these adverse effects may exist regardless of whether the tolerant crop is a product of modern biotechnology or conventional breeding, some specific issues may be more relevant in the case of abiotic stress tolerant LM crops.

**Characterization of the LM crop with tolerance to abiotic stress in comparison with its non-modified crop (see step 1 of the Roadmap for Risk Assessment)**

**Rationale:**

The first step in the risk assessment process involves the characterization of genotypic or phenotypic, biological, intended and unintended changes associated with the abiotic stress tolerant LM crop that may have adverse effects on biodiversity in the likely receiving environment, taking into account risks to human health. This step is the ‘hazard identification step’ in other risk assessment guidance.

The identification of genotypic and phenotypic changes in the abiotic stress tolerant LM crop, either intended or unintended, is typically done in comparison with the non-modified recipient organism (see step 1 of the Roadmap). The non-modified comparator provides the baseline information for comparison of trials when it is grown at the same time and location as the LM crop. Comparisons with the observed range of changes in the non-modified crop in different environments, also provides baseline information.

**Challenges with respect to experimental design:** Abiotic stress crops may present unique challenges in experimental design for risk assessment. In some cases, for instance, an approach uses different reference plant lines, which typically include a range of genotypes representative of the natural variation in the crop species. In such conditions, choosing appropriate comparators could be a challenge and there are several proposals on whether and how the comparative approach can be used to characterize LM crops tolerant to abiotic stress in these likely receiving environments. Another important consideration is whether the experimental design properly controlled for the effect of the abiotic stress trait. In the extreme case, when the non-modified crop has never been grown in the range of conditions of the receiving environment because the abiotic stress conditions prevent or severely affect the growth of the non-modified crop, a comparative approach between the LM crop and the non-modified crop will need to be adjusted.

The use of non-isogenic reference lines can make it more difficult to identify statistically meaningful differences. In some situations when a comparator may not be available to carry out a meaningful comparison, a characterization of the abiotic stress tolerant LM crop as a novel genotype in the receiving environment may be conducted. In the future, information available from “omics” technologies, for example, “transcriptomics” and “metabolomics”, if available, may help to detect phenotypes (e.g., the production of a novel allergen or anti-nutrient) that cannot be detected using a comparison between field grown plants at a suboptimal condition.

/...
Points to consider:

(a) Characteristics of the LM crop under the abiotic stress and non-stress conditions and under different stresses, if applicable;

(b) Likelihood of gene flow to wild or domestic relatives; and

(c) Whether one or more suitable comparators are available and the possibility of their use in the appropriate experimental design.

Unintended characteristics (see step 1 of the Roadmap for Risk Assessment)

Rationale:

Both intended and unintended changes to the LM crop which are directly or indirectly associated with the abiotic stress tolerance that may have adverse effects should be identified. These include changes to the biology of the crop plant (e.g. if the genes alter multiple characteristics of the plant) or to its distribution range in relation to the potential receiving environment (e.g. if the plant can grow where it has not grown before), that may cause adverse effects.

The abiotic-stress-tolerant LM crop may have unintended characteristics such as tolerances to other types of biotic and abiotic stresses, which could lead to a selective advantage of these crop plants under conditions other than that related to the modified trait. For instance, crops modified to become tolerant to drought or salinity may be able to compete better than their counterparts at lower and higher growing temperatures.

It is also possible the LM crops with enhanced tolerance to an abiotic stress could have changes in seed dormancy, viability, and/or germination rates under other types of stresses. Particularly if genes involved in abiotic stress are also involved in crucial steps in physiology, modifications involving these genes may, therefore, have pleiotropic effects. Such LM crops may also transfer genes for stress tolerance at higher frequencies than observed in non-modified crops.

A potential mechanism for interactions between abiotic and biotic stresses may exist in plants. For example, drought or salinity-tolerant LM crops may acquire a changed tolerance to biotic stresses, which could result in changed interactions with their predators, parasitoids and pathogens, and, therefore, have both direct and indirect effects on organisms that interact with them.

Points to consider:

(a) Any intended or unintended change that may lead to selective advantage or disadvantage acquired by the LM crop under other abiotic or biotic stress conditions that could cause adverse effects;

(b) Any change in the resistance to biotic stresses and how these could affect the population of organisms interacting with the LM crop; and

(c) A change in the substances (e.g., toxin, allergen, or nutrient profile) of the LM crop that could cause adverse effects.

Increased persistency in agricultural areas and invasiveness of natural habitats (see steps 1, 3 and 5 of the Roadmap for Risk Assessment)
Rationale:

Climate change, water depletion or elevated salt content are examples of factors that limit the growth, productivity, spread or persistence of a crop. Expression of the genes for abiotic stress tolerance could result in increased persistence of the modified crop in agricultural areas. Expression of these genes may also alter the capacity of LM crops to spread to and establish in climatic and geographic zones beyond those initially considered as the likely or potential receiving environments.

The gene(s) inserted for tolerance to, for instance, drought and salinity might also affect molecular response mechanisms to other forms of abiotic stress, such as cold temperatures. For example, when the genetic modification affects genes that also regulate key processes in seeds, such as abscisic acid (ABA) metabolism, physiological characteristics such as dormancy and accumulation of storage lipids may also be changed. In such cases, the seeds of a tolerant crop, modified for drought or salinity tolerance, may acquire in addition tolerance to cold resulting in an increased winter survivability of the seeds. Therefore, an abiotic stress-tolerant crop may acquire the potential to persist better than its conventional counterpart under different abiotic-stress conditions.

Points to consider:

(a) Consequences of the increased potential for persistency of the modified crop in agricultural habitats and consequences of increased potential for invasiveness in natural habitats;

(b) Need for control measures if the abiotic stress-tolerant crop shows a higher potential for persistency in agricultural or natural habitats, that could cause adverse effects;

(c) Characteristics that are generally associated with weediness such as prolonged seed dormancy, long persistence of seeds in the soil, germination under a broad range of environmental conditions, rapid vegetative growth, short lifecycle, very high seed output, high seed dispersal and long-distance seed dispersal; and

(d) Effects of climate change on agriculture and biodiversity and how this could change the habitat range of the LM crop in comparison to the non modified crop.

(e) If the LM crop expressing tolerance, would have a change in its agriculture practices.

C. RISK ASSESSMENT OF LIVING MODIFIED MOSQUITOES

INTRODUCTION

Living modified (LM) mosquitoes are being developed through modern biotechnology to reduce transmission of vector borne human pathogens, particularly those that cause malaria, dengue and chikungunya. Control, including eradication of such diseases, is a recognized public health goal. Some of the strategies being developed are to control mosquito vectors by suppressing their population or reducing their competence. These strategies can be subcategorized according to the technology involved and the method used. Some are intended to develop LM mosquitoes that are genetically modified to be sterile or self-limiting (i.e., unable to pass the modified trait on indefinitely through subsequent generations). Modern biotechnology techniques for developing sterile LM mosquitoes are different from those based on the use of irradiation to induce male sterility.

Other modern biotechnology strategies are also being used for developing LM mosquito populations that are self-sustaining or self-propagating (i.e., heritable modifications intended to spread through the target population). The strategy used is an important factor to be considered in the risk assessment and risk management process since there might be different points to be considered, depending on the specific strategy used.

The biology and ecology of mosquitoes on the one hand, and their impact on public health as vectors of human and animal diseases on the other hand, pose new considerations and challenges during the risk assessment process, which have mainly dealt with LM crop plants thus far.

This guidance document provides information for the risk assessment of environmental releases of LM mosquitoes and aims at helping to conduct risk assessments for environmental releases of LM mosquitoes. Although the focus of this guidance is on LM mosquitoes, in principle, it may also be useful for the risk assessment of similar non-LM mosquito strategies.

The main emphasis of this guidance document is the assessment of potential risks to biodiversity. Nevertheless, the potential adverse effects to human health arising from environmental releases of LM mosquitoes should also be considered.

This guidance document complements the Roadmap for Risk Assessment developed by the AHTEG on Risk Assessment and Risk Management and focuses on specific issues that may need special consideration on the risk assessment for environmental releases of LM mosquitoes.

OBJECTIVE

The objective of this document is to give additional guidance on the risk assessment (RA) of LM mosquitoes in accordance with Annex III to the Cartagena Protocol on Biosafety. Accordingly, it aims at complementing the Roadmap for Risk Assessment on specific issues that may need special consideration for the environmental release of LM mosquitoes.

47 The Parties to the Cartagena Protocol on Biosafety have mandated the AHTEG to ‘develop a “roadmap”, such as a flowchart, on the necessary steps to conduct a risk assessment in accordance with Annex III to the Protocol and, for each of these steps, provide examples of relevant guidance documents’. The Roadmap is meant to provide reasoned guidance on how, in practice, to apply the necessary steps for environmental risk assessment as set out in Annex III of the Protocol. The Roadmap also demonstrates how these steps are interlinked.
SCOPE

This document focuses on the specifics aspects of risk assessment of LM mosquitoes developed to be used in the control of human and zoonotic diseases such as malaria, dengue, chikungunya, yellow fever and West Nile.

ISSUES TO BE CONSIDERED IN THE RISK ASSESSMENT

(See step 1 of the Roadmap for Risk Assessment of LMOs)

Specific and comprehensive considerations should be undertaken with respect to the potential adverse effects of a particular LM mosquito, taking into account the species of the mosquito, the LM trait, the intended receiving environment, and the objective and scale of the intended release. These considerations should focus on, for instance: (a) description of the genetic modification; (b) the kinds of possible adverse effects for which there are scientifically plausible scenarios; (c) the species and ecological processes that could be affected by the introduction of the LM mosquitoes; (d) the protection goals of the country where the LM mosquitoes will be introduced; and (e) a conceptual link between the identified protection goals and the introduction of the LM mosquito into the environment.

The biology and, to some extent, the ecology of the mosquito species that transmit malaria and dengue are well known in many regions of the world. However, in certain regions and in the environment where the LM mosquito is likely be released, more information may be needed depending on the nature and scale of the LM strategy to be deployed. In many of these environments few studies have been conducted to examine gene flow among vectors, their mating behaviour, the interactions between vectors sharing one habitat, how pathogens respond to the introduction of new vectors, etc. Such information may be needed to establish a baseline in order to successfully assess the risks of LM mosquitoes. Additionally, methods for the identification of specific ecological or environmental hazards are also needed.

Effects on biological diversity (species, habitats, ecosystems, and ecosystem services)

(See step 2 of the Roadmap for Risk Assessment of LMOs)

Rationale:

The release of LM mosquitoes may have a negative impact on the target vector and pathogen and other species, such as:

New or more vigorous pests, especially those that have adverse effects on human health: (i) the released LM mosquitoes may not function as expected, for example gene silencing or production failures could result in the release of non-sterile or competent mosquitoes and thus increase the vector population or disease transmission; (ii) the released LM mosquitoes could transmit another disease more efficiently than indigenous non-LM mosquitoes, such diseases might include yellow fever, chikungunya, etc.; (iii) suppression of the target mosquito might result in the population of another vector species to increase and result in higher levels of the target disease or the development of a new disease in humans and/or animals. These other vector species may include other mosquito vectors of other diseases; (iv) the released LM mosquitoes might become pests; (v) the released LM mosquitoes might cause other pests to become more serious, including agricultural pests and other pests that affect human activities.

---

48 For the purpose of this guidance, the term “target vector” refers to the mosquito that transmits the disease and “target pathogen” is the disease causing agent transmitted by the target mosquito.
Harm to or loss of other species: The released LM mosquitoes might cause other species (for instance fish that rely seasonally on mosquitoes for food) to become less abundant. These include species of ecological, economic, cultural and/or social importance such as wild food, endangered, keystone, iconic and other relevant wildlife species. Ecological effects might result from competitive release if the target mosquito population is reduced or from trophic consequences of species that rely on mosquitoes for food at specific times of the year. Effects may also occur if (i) the target mosquitoes transmit a disease to animal species, (ii) the released LM mosquitoes transmit a disease to animal species more efficiently, (iii) another vector of an animal disease was released from control when the target mosquito population was reduced, or (iv) the population of a target pathogen is reduced or lost and this may affect other organisms that interact with it.

Although mosquitoes, like other insects, typically have strong reproductive isolating mechanisms that will not allow interspecific gene flow, if sterile interspecific mating between released LM mosquitoes and other mosquito species should occur, it could disrupt the population dynamics of these other species, leading to harm or loss of valued ecological species. Moreover, cessation of transmission of pathogens to other animals (e.g., West Nile virus to birds, Rift Valley fever virus to African mammals) might alter the population dynamics of those species, favouring increases in their numbers.

Disruption of ecological communities and ecosystem processes: The ecological communities in the ephemeral, small aquatic habitats occupied by the non-LM mosquitoes are unlikely to be disrupted beyond the possibilities already addressed above under “harm to or loss of other species.” However, if the released LM mosquitoes were to inhabit natural habitats (e.g., tree-holes), disruption of the associated community is a possibility. The released LM mosquitoes might degrade some valued ecosystem process. This might include processes such as pollination or support of normal ecosystem functioning. These processes are often referred to as “ecosystem services”. However, the valued ecosystem processes may also be culturally or socially specific. Under some circumstances, mosquito species are significant pollinators. In those cases, mosquito control of any kind might reduce the rate of pollination of some plant species or cause a shift to different kinds of pollinators. Habitats in which mosquitoes are the dominant insect fauna (e.g., high Arctic tundra, tree holes) would be changed if mosquitoes were eliminated; however, the common target vector species are usually associated with human activity and therefore not as closely tied to ecosystem services.

Points to consider:

(a) Impacts on the target mosquitoes and pathogens resulting from the use of the strategy under consideration;

(b) Whether the LM mosquitoes have the potential of causing adverse effects on other species which will result in the other species becoming agricultural, aquacultural, public health or environmental pests, or nuisance or health hazards;

(c) Whether the target mosquito species is native or invasive to a given area;

(d) The habitat range of the target mosquito species and whether the habitat range is likely to be affected by climate change;

(e) Any other species (e.g. animal hosts, larval pathogens or predators of mosquitoes) in addition to the pathogen, that typically interact with the LM mosquito in the likely receiving environment;

(f) Whether the release of LM mosquitoes is likely to affect other mosquito species that are pollinators or otherwise known to be beneficial to ecosystem processes;

(g) Whether the LM mosquitoes are likely to have an adverse effect on other interacting organisms, e.g. predators of mosquitoes;
Whether species replacement by other disease vector species may occur, and if so, whether it can result in an increased incidence of the target disease or new diseases in humans or animals.

**Gene Flow**

*(See steps 2 and 3 of the Roadmap for Risk Assessment of LMOs)*

**Rationale:**

With regard to the biosafety of LM mosquitoes, gene flow refers to the transfer of transgenes or genetic elements from the LM mosquitoes to non-LM mosquitoes. It can occur via cross-fertilisation or other movement of the transgenes or genetic elements. Various factors may influence gene flow and any associated adverse effects, such as, the strategy, the transgenes, the gene drive system, and the stability of the trait(s) carried by the mosquito over generations, as well as the receiving environment, etc.

*Gene flow through cross-fertilization:* Some LM mosquitoes are being developed to spread the introduced trait rapidly through the target mosquito population. For instance, when introduced into *Anopheles gambiae*, the trait may be expected to spread throughout the *A. gambiae* species complex. Other LM mosquito technologies are designed to be self-limiting and, in such cases, spread of the transgenes or genetic elements in the target mosquito population is not intended or expected. For the self-limiting technologies, the potential for an unexpected spread of the introduced trait should be considered by focusing on the assumption that any management strategy to limit the spread could fail. Gene flow between different species should be considered for all of the LM mosquito technologies in spite of the fact that mosquitoes, like other insects, typically have strong reproductive isolating mechanisms that will not allow interspecific gene flow. Identifying the key reproductive isolating mechanisms and possible conditions that could lead to the breakdown of such mechanisms is of particular importance in the risk assessment of LM mosquitoes with this trait. In addition, the fitness conferred by the introduced trait and the population size and frequency of the introduction of the LM mosquito into the environment will also determine the likelihood and rate of spread of the transgenes or genetic elements.

*Horizontal gene flow:* For the purpose of this document, “horizontal gene flow”, is the movement of genetic information from one organism to another through means other than sexual transmission. Gene drive systems for moving genes into wild populations may be the initial focus of the risk assessment. The risk of horizontal gene flow in LM mosquitoes that do not contain a gene drive system is likely to be smaller but should nevertheless be assessed on a case-by-case basis.

*Persistence of the transgene in the environment.* Some of the transgenes in LM mosquitoes are designed not to persist whereas others are expected to spread rapidly and/or persist through wild populations. In cases where the LM mosquitoes have been found through the risk assessment process to have the potential to cause adverse effects to the biological diversity, taking also into account human health, methods to reduce the persistence of the transgene in the environment needs to be considered.

---

49 For the purpose of this document, a transgene is a nucleic acid sequence in an LMO that results from the application of modern biotechnology as described in Article 3 (i) a of the Protocol.

50 Gene drive systems are methods of effectively introducing the desired gene into a mosquito population (Selfish DNA versus Vector-Borne Disease, Environmental Health Perspectives (2008) 116 - [http://www.ncbi.nlm.nih.gov/pmc/articles/PMC2235231/pdf/ehp0116-a00066.pdf](http://www.ncbi.nlm.nih.gov/pmc/articles/PMC2235231/pdf/ehp0116-a00066.pdf)).
Points to consider:

(a) Whether LM mosquitoes have the potential to transfer the modified traits to wild mosquito populations (when it is not an intended strategy) and/or to non-related organisms, and if so, the occurrence of any potential undesirable consequences;

(b) Whether the LM mosquitoes have the potential to induce undesirable characteristics, functions, or behaviour within the target mosquito species, other wild related species or non-related organisms;

(c) Any undesirable consequence should the transgene persist in the environment.

Evolutionary responses (especially in target mosquito vectors or pathogens of humans and animals)

(See step 1 of the Roadmap for Risk Assessment of LMOs)

Rationale:

Any strong ecological effect also exerts an evolutionary selection pressure on the human and animal pathogens and the mosquito vectors. The main evolutionary effects are those that could result in a breakdown in the effectiveness of the technology and the resumption of previous disease levels. Some LM mosquito strategies aim at modifying the mosquito vector’s ability to transmit diseases through changes in its physiological mechanisms. An evolutionary effect resulting in the development of resistance to physiological mechanisms in the targeted pathogen might occur when modifying mosquito vector competence. This might harm the effectiveness of the strategy used and result in a population of pathogens that may be transmitted more easily by all types of vectors.

Other evolutionary effects could be hypothesized, including effects resulting from climate change, but they would first require the occurrence of some adverse effect on a species, community or ecosystem effect. Therefore, consideration of secondary evolutionary effects can be postponed until such effects are identified and found to be significant.

Points to consider:

(a) Whether the target mosquito vector has the potential to evolve and avoid population suppression, regain vector competence or acquire new or enhanced competence to another disease agent, and if so, the occurrence of any possible undesirable consequences;

(b) Whether the trait has the potential to evolve and thus lose its effectiveness, or the pathogen to evolve and overcome the limitation posed by the genetic modification, and if so, the occurrence of any possible undesirable consequences.

RISK-MANAGEMENT STRATEGIES

(See step 5 of the Roadmap for Risk Assessment of LMOs)

Risk assessors may want to consider risk-management strategies such as the quality control of the released LM mosquitoes and monitoring them and the environment for potential unintended adverse effects. There should also be strategies in place for halting the release and application of mitigation methods if an unanticipated effect occurs. Careful implementation of the technology including the availability of mitigations measures (such as an alternative set of control measures should a problem occur) and the integration of other population control methods should be considered. In some
circumstances methods to reduce the persistence of the transgene in the environment or to mitigate adverse effects resulting from the expression of the transgene might be needed. Monitoring during and after the environmental release of the LM mosquitoes so as to address prompt detection of unexpected adverse effects may also be considered.

Points to consider:

(a) Availability of monitoring methods to:

(i) Measure the efficacy and effectiveness of LM mosquito technology;

(ii) Assess the potential evolutionary breakdown of the LM mosquito technology (monitoring for transgene stability and proper function over time);

(iii) Determine the level to which the identified adverse effects may be realized, including detection of unexpected and undesirable spread of the transgenic trait (monitor for undesirable functions or behaviours within target species and other wild related species).

(b) Availability of mechanisms to recall the LM mosquitoes and transgenes in case they spread unexpectedly (e.g. mass release of wild-type mosquitoes above a certain threshold, alternative control methods including genetic control).

(c) Availability of methods for managing the dispersal of the LM mosquitoes and ensuring that they do not establish themselves beyond the intended receiving environment (e.g. vegetation-free zones, traps, high threshold gene drive systems).

(d) Availability of methods to manage potential development of resistance, e.g. in the target vector or pathogen.

OTHER ISSUES

There are other factors that may be taken into consideration in the decision for environmental releases of LM mosquitoes which are not covered by Annex III of the Protocol. They encompass, inter alia, social, economic, cultural and health issues associated with the application and acceptance of the technology.

Annex IV

RECOMMENDATIONS TO THE CONFERENCE OF THE PARTIES SERVING AS THE MEETING OF THE PARTIES TO THE CARTAGENA PROTOCOL ON BIOSAFETY AT ITS FIFTH MEETING

1. The Ad Hoc Technical Expert Group (AHTEG) on Risk Assessment and Risk Management took note of the deliberations under the Open-ended Online Expert Forum on Risk Assessment and Risk Management in particular about the need for further guidance on specific aspects of risk assessment and considered the existing guidance materials on risk assessment of living modified organisms.

2. The AHTEG recognized the importance of involving experts in the various scientific and technical fields relevant to risk assessment in any future activity taking into account the limited financial and human resources.

3. The following recommendations were made by the AHTEG:

   (a) The document “Guidance on Risk Assessment of Living Modified Organisms” should be published and distributed, including an online version under the Biosafety Clearing-House (BCH), in all UN languages;

   (b) The “Guidance on Risk Assessment of Living Modified Organisms” should be further tested for example during regional workshops including cooperation with existing initiatives for capacity-building and training, as appropriate;

   (c) The “Guidance on Risk Assessment of Living Modified Organisms” should be revisited within two years and the need for an update of the list of background materials should be assessed within a year;

   (d) Further development of guidance on risk assessment of living modified organisms should be considered. The topics identified and prioritized during the first meeting of the AHTEG as well as those mentioned at the second meeting could be the starting point for the further development of guidance on risk assessment (see list annexed hereto as annex V);

   (e) A process should be established for the incorporation of background materials, available in the Biosafety Information Resources Centre of the Biosafety Clearing-House, that are relevant in the different sections of the “Guidance on Risk Assessment of Living Modified Organisms”. In order to assist this process, the Secretariat should be requested to revise the common format for submission of records to the Biosafety Information Resources Centre (BIRC) of the BCH with the view to identifying and including a mechanism to link BIRC records on risk assessment to specific sections of the guidance document;

   (f) Recognizing that the exchange of information is a central element for identifying living modified organisms or specific traits that have been assessed as having the potential to cause adverse effects on the conservation and sustainable use of biological diversity taking also into account risks to human health, a process should be established by:

   (i) Urging Parties and inviting non-Parties to submit relevant information to the BCH on experiences in conducting risk assessment with regard to this topic;

/…
(ii) Requesting the Secretariat to undertake a regular analysis of the information contained in the BCH within the context of this process and reporting to the COP-MOP for that purpose;

(iii) Organizing workshops where the information submitted would be analyzed through a guided-process.

(g) The goals of the above recommendations (a) to (f) could be achieved by a combination of an extended Open-ended Online Expert Forum on Risk Assessment and Risk Management and an AHTEG on Risk Assessment and Risk Management, as well as a combination of online conferences, ad hoc discussion groups and face-to-face meetings with a view to:

(i) Developing additional guidance documents on the basis of the “Guidance on Risk Assessment of Living Modified Organisms” on specific types of living modified organisms and traits;

(ii) Reviewing the text of the “Guidance on Risk Assessment of Living Modified Organisms” and updating the lists of background materials;

(iii) Incorporating background materials, available in the Biosafety Information Resources Centre of the Biosafety Clearing-House, that are relevant to the different sections of the “Guidance on Risk Assessment of Living Modified Organisms”;

(iv) Analysing the results of the workshops on living modified organisms or specific traits that have been assessed as having the potential to cause adverse effects.

(h) Human and financial resource implications should be considered for the process set up to achieve the above goals.
TOPICS FOR THE DEVELOPMENT OF GUIDANCE MATERIALS ON RISK ASSESSMENT

Further topics identified in the first meeting of the AHTEG as priorities for the development of guidance:

- Post-release monitoring and long-term effects of LMOs released into the environment;
- Risk assessment and risk management in specific receiving environments;
- Risk assessment of living modified microorganisms and viruses;
- Risk assessment of living modified pharmaplants;
- Risk assessment of living modified crops;
- Risk assessment of living modified trees;
- Risk assessment of living modified fish;
- Risk assessment living modified organisms for production of pharmaceutical and industrial products;
- “Co-existence” between LMOs and non-LMOs in the context of small scale farming;
- Risk assessment of living modified plants for biofuels;
- Risk assessment of living modified organisms produced through synthetic biology.

Further topics identified in the second meeting of the AHTEG as possible priorities for the development of guidance:

- Uncertainty analysis;
- Establishment of criteria for transparency and reproducibility of information;
- Interface between risk assessment and risk management;
- Environmental risk assessment and monitoring taking into account human health;
- Unintentional transboundary movements;
- Risk assessment and management of LMOs intended for introduction into unmanaged environments.

-----
