Group on Earth Observations – Biodiversity Observation Network

What is **GEO?**

A Global, Coordinated,
Comprehensive and Sustained
System of Observing Systems

What is **GEOBON?**

Coordinated global
network for improving
biodiversity observations

Ministério do Meio Ambiente

Connections to the CBD

- GEO BON is **user-driven**, producing **tools and products useful at the national scale**
- Specific **focus on the CBD** and the **Strategic Plan for Biodiversity**
- GEO BON **highlighted** in a number of **CBD Decisions**:
 - Decision COP XI/3 (13) – continue work on the EBVs
 - SBSTTA Recommendation 17/1 – EBVs and BON in a Box
 - Decision COP XII/1 - invite parties & others to collaborate with GEO BON to build observation systems addressing priority needs.
- SBSTTA19 Session3 – majority of statements pointed to the **need for effective biodiversity observation systems**

GEO BON Approach

- Provide a robust, extensive and harmonized framework for biodiversity observations and systems that meet user needs
- Top-Down:
 - Focus on a targeted set of variables (e.g. EBVs) and develop global observation frameworks (e.g. GWOS, GSEO, etc.) and products (biodiversity change indicators)
- Bottom-Up:
 - Facilitate enhanced and new biodiversity observations through national and regional capacity building (e.g. national and regional BONs and BON in a Box)

Top Down: Essential Biodiversity Variables

Cover dimensions of biodiversity

Allow aggregation and disaggregation

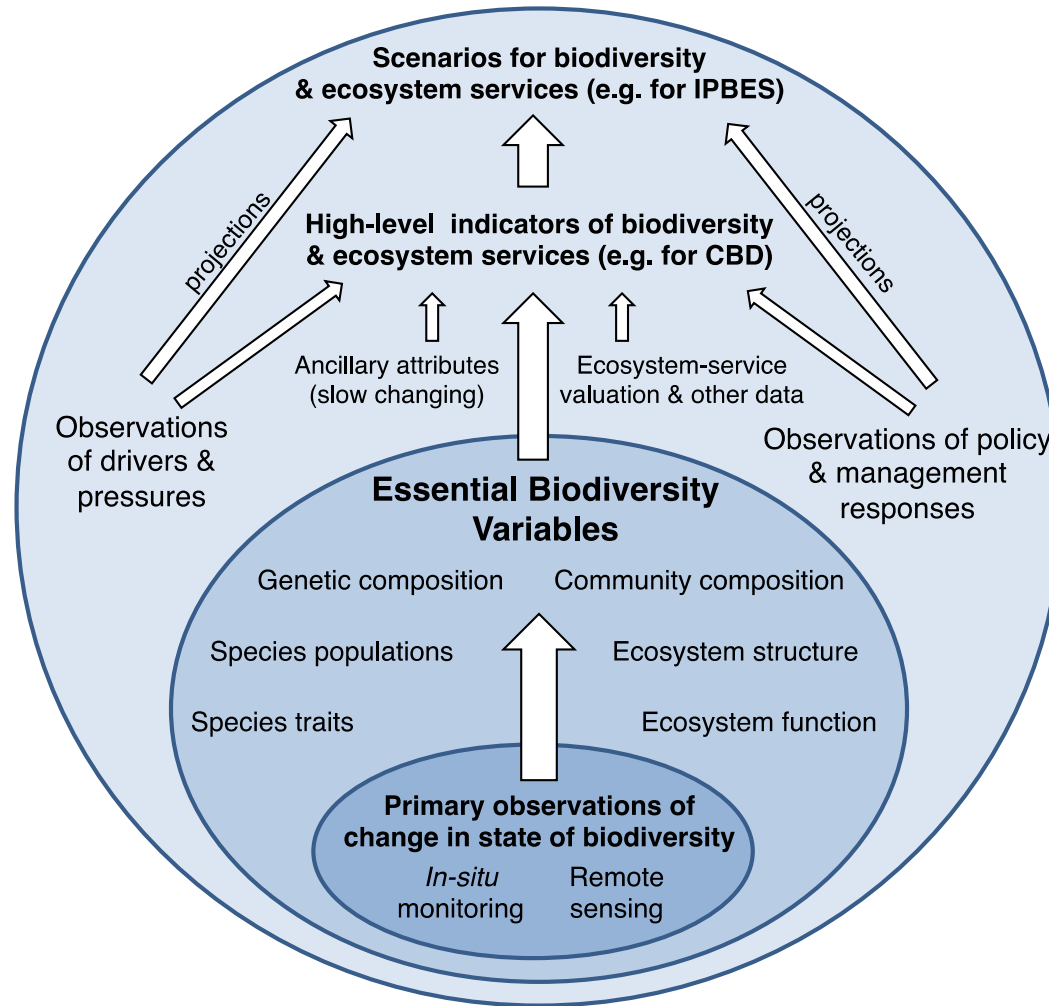

Ability to detect change

Pereira, H.M. et al (2013)
Science

EXAMPLES OF CANDIDATE ESSENTIAL BIODIVERSITY VARIABLES

EBV class	EBV examples	Measurement and scalability	Temporal sensitivity	Feasibility	Relevance for CBD targets and indicators (1,9)
Genetic composition	Allelic diversity	Genotypes of selected species (e.g., endangered, domesticated) at representative locations.	Generation time	Data available for many species and for several locations, but little global systematic sampling.	Targets: 12, 13. Indicators: Trends in genetic diversity of selected species and of domesticated animals and cultivated plants; RLI.
Species populations	Abundances and distributions	Counts or presence surveys for groups of species easy to monitor or important for ES, over an extensive network of sites, complemented with incidental data.	1 to >10 years	Standardized counts under way for some taxa but geographically restricted. Presence data collected for more taxa. Ongoing data integration efforts (Global Biodiversity Information Facility, Map of Life).	Targets: 4, 5, 6, 7, 8, 9, 10, 11, 12, 14, 15. Indicators: LPI; WBI; RLI; population and extinction risk trends of target species, forest specialists in forests under restoration, and species that provide ES; trends in invasive alien species; trends in climatic impacts on populations.
Species traits	Phenology	Timing of leaf coloration by RS, with in situ validation.	1 year	Several ongoing initiatives (Phenological Eyes Network, PhenoCam, etc.)	Targets: 10, 15. Indicators: Trends in extent and rate of shifts of boundaries of vulnerable ecosystems.
Community composition	Taxonomic diversity	Consistent multitaxa surveys and metagenomics at select locations.	5 to >10 years	Ongoing at intensive monitoring sites (opportunities for expansion). Metagenomics and hyperspectral RS emerging.	Targets: 8, 10, 14. Indicators: Trends in condition and vulnerability of ecosystems; trends in climatic impacts on community composition.
Ecosystem structure	Habitat structure	RS of cover (or biomass) by height (or depth) globally or regionally.	1 to 5 years	Global terrestrial maps available with RS (e.g., Light Detection and Ranging). Marine and freshwater habitats mapped by combining RS and in situ data.	Targets: 5, 11, 14, 15. Indicators: Extent of forest and forest types; mangrove extent; seagrass extent; extent of habitats that provide carbon storage.
Ecosystem function	Nutrient retention	Nutrient output/input ratios measured at select locations. Combine with RS to model regionally.	1 year	Intensive monitoring sites exist for N saturation in acid-deposition areas and P retention in affected rivers.	Targets: 5, 8, 14. Indicators: Trends in delivery of multiple ES; trends in condition and vulnerability of ecosystems.

Essential Biodiversity Variables

Challenges for monitoring biodiversity from in-situ measurements

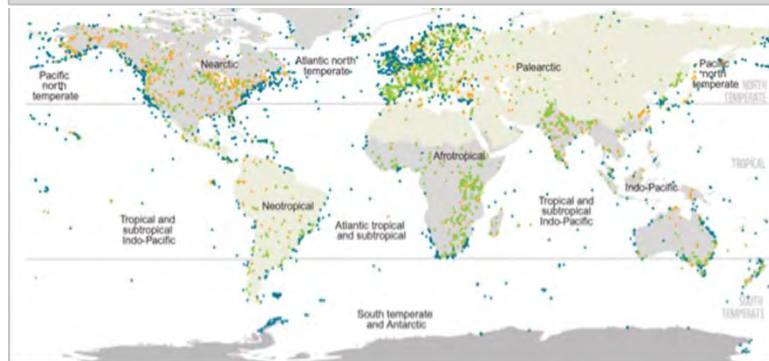

Taxonomic dimension

BON IN A BOX

Herramientas de monitoreo para necesidades específicas

Better information on the status, trends and drivers of biodiversity change is needed to assist governments in developing more effective and timely policy responses. There are many **excellent tools, protocols and software** in use that facilitate effective biodiversity monitoring but these are not easily discoverable or available to all regions of the planet. As well, current efforts to monitor biodiversity are not interoperable, thereby limiting our ability to detect change and the underlying mechanisms driving change in biodiversity.

BON in a Box aims to serve as a technology transfer mechanism that allows countries access to the most advanced and effective monitoring protocols, tools and software thereby, lowering the threshold for a country to set up, enhance or harmonize a national biodiversity observing system.

BON in a Box is a **regionally customizable** and continually updated online toolkit for facilitating the start-up or enhancement of national or regional biodiversity observation systems

GEO BON

BON in a BOX

BON-in-a-Box is a **digital, customizable, 'smart' toolkit for biodiversity observations**
Purpose

1. Serve as a **technology transfer mechanism** allowing access to the most advanced and effective monitoring protocols, tools and software;
2. **Lower the threshold for a country** to set up, enhance or harmonize a national biodiversity observing system.

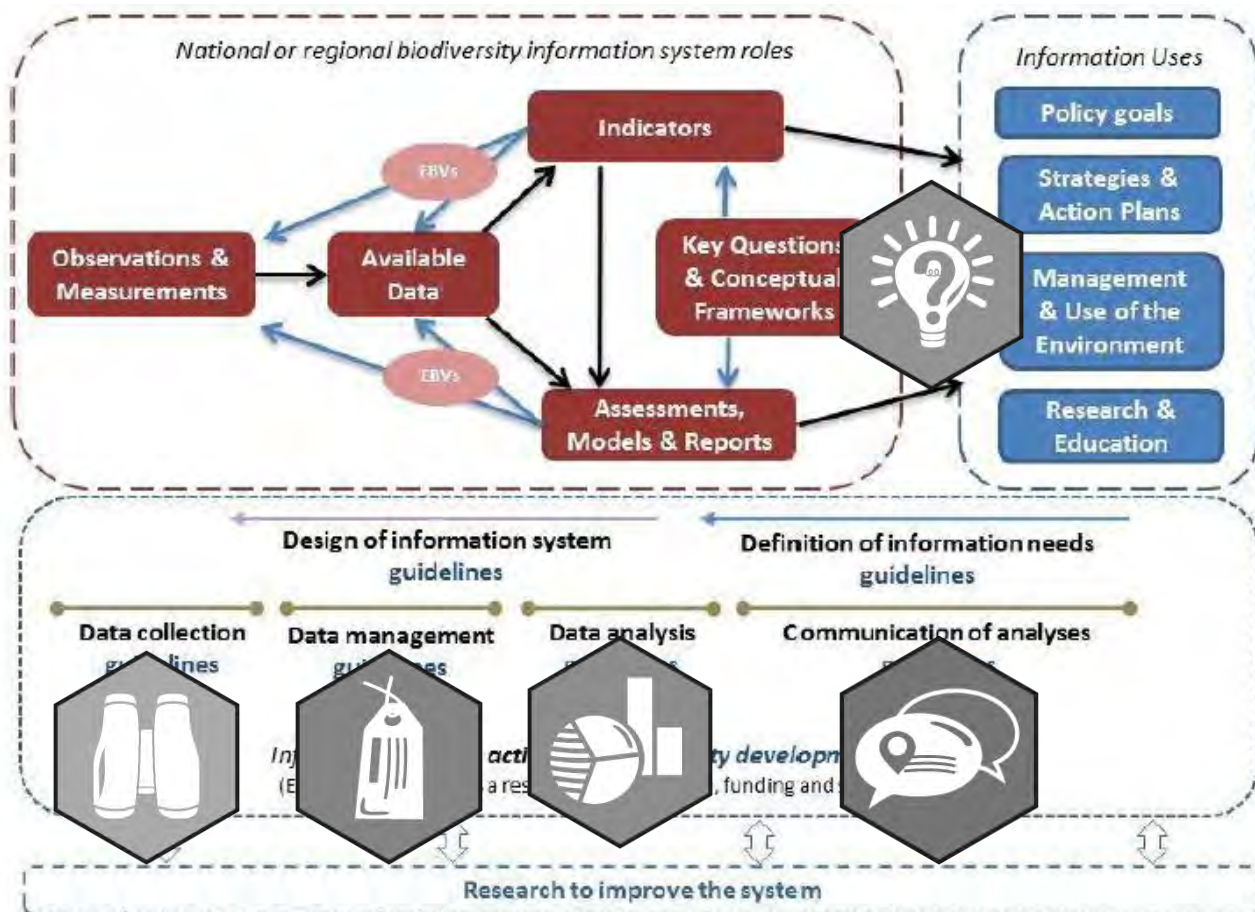

3. Foster **regional sharing** of best practices and technology; and,
4. Advance **interoperability** – promote uptake of harmonized observations, data management, analysis & reporting through the use of consistent tools, protocols and data.
5. **Improve the power** to detect & attribute biodiversity trends

BON IN A BOX

Herramientas de monitoreo para necesidades específicas

Bon in a Box es un set de herramientas en línea para monitoreo, customizable y en constante actualización. Todo esto con el motivo de facilitar el inicio o la mejora de los sistemas de observación de la Biodiversidad.

Bon in a Box proporciona un conjunto de variables de biodiversidad científicamente validadas, herramientas de diseño, métodos y directrices de monitoreo, lo que reduce el umbral para la puesta en marcha o mejora de un sistema de observación de la biodiversidad.

MONITORING COMPONENTS

DATA MANAGEMENT

Standards and Interoperability

| Data collection |

There is an enormous amount of biodiversity information that comes from many sources and different types of formats. To be able to take advantage of this depends on the use of standards. Data standards **ensure interoperability of the major initiatives of biodiversity information** in the world to organize and unify how they are issued. Under this label you will find documentary and technological tools such as web platforms and software that allow data standardization and publication of resources.

ESSENTIAL BIODIVERSITY VARIABLES

EBV By Theme

COMMUNITIES COMPOSITION

Diversity and interactions between species

Under this label you will find specific tools to **capture, analyze and/or communicate data at the level of biological communities**, meaning information on which species live together. Includes multi-taxa observations and data obtained with metagenomic techniques. Also tools for observations of interactions between species and/or species networks. For example, plant-animal systems such as dispersers and pollinators.

FILTERS BY KIND

By Kind

DATASET

Metadata, data and information

A dataset is a collection or group of records that share a grouping criteria. This criteria can be a methodology, an obtaining purpose, a geographic area, a time reference, etc. Datasets should refer to a set of metadata, which describes the content, quality, condition and other characteristics of the data in a standardized format, **ensuring the viability and permanence of the data sets**, in order to ease their use for multiple purposes and in different contexts. Under this label you'll find the link to the main portals that give access to data sets on biodiversity observations.
